Introduction to Machine Learning

Introduction to Machine Learning

What is Machine Learning?

*The subfield of computer science that “gives computers the ability to learn without being explicitly programmed”.
(Arthur Samuel, 1959)*

*A computer program is said to learn from experience E with respect to some class of tasks T and performance measure P if its performance at tasks in T , as measured by P , improves with experience E .”
(Tom Mitchell, 1997)*

Using data for **answering questions**
Training **Predicting**

Accessibility

Data already available everywhere

Low storage costs: everyone has several GBs for “free”

Hardware more **powerful** and **cheaper** than ever before

Devices

Everyone has a powerful computer packed with sensors:

- ▶ GPS
- ▶ Cameras
- ▶ Microphones

Permanently connected to the Internet

Services

Cloud Computing:

- ▶ Online storage
- ▶ Infrastructure as a Service

User applications:

- ▶ YouTube
- ▶ Gmail
- ▶ Facebook
- ▶ Twitter

Types of Machine Learning problems

Supervised

Unsupervised

Reinforcement

Supervised

Learn through **examples** of which we know the desired output (what we want to predict).

Is this a cat or a dog?

Unsupervised

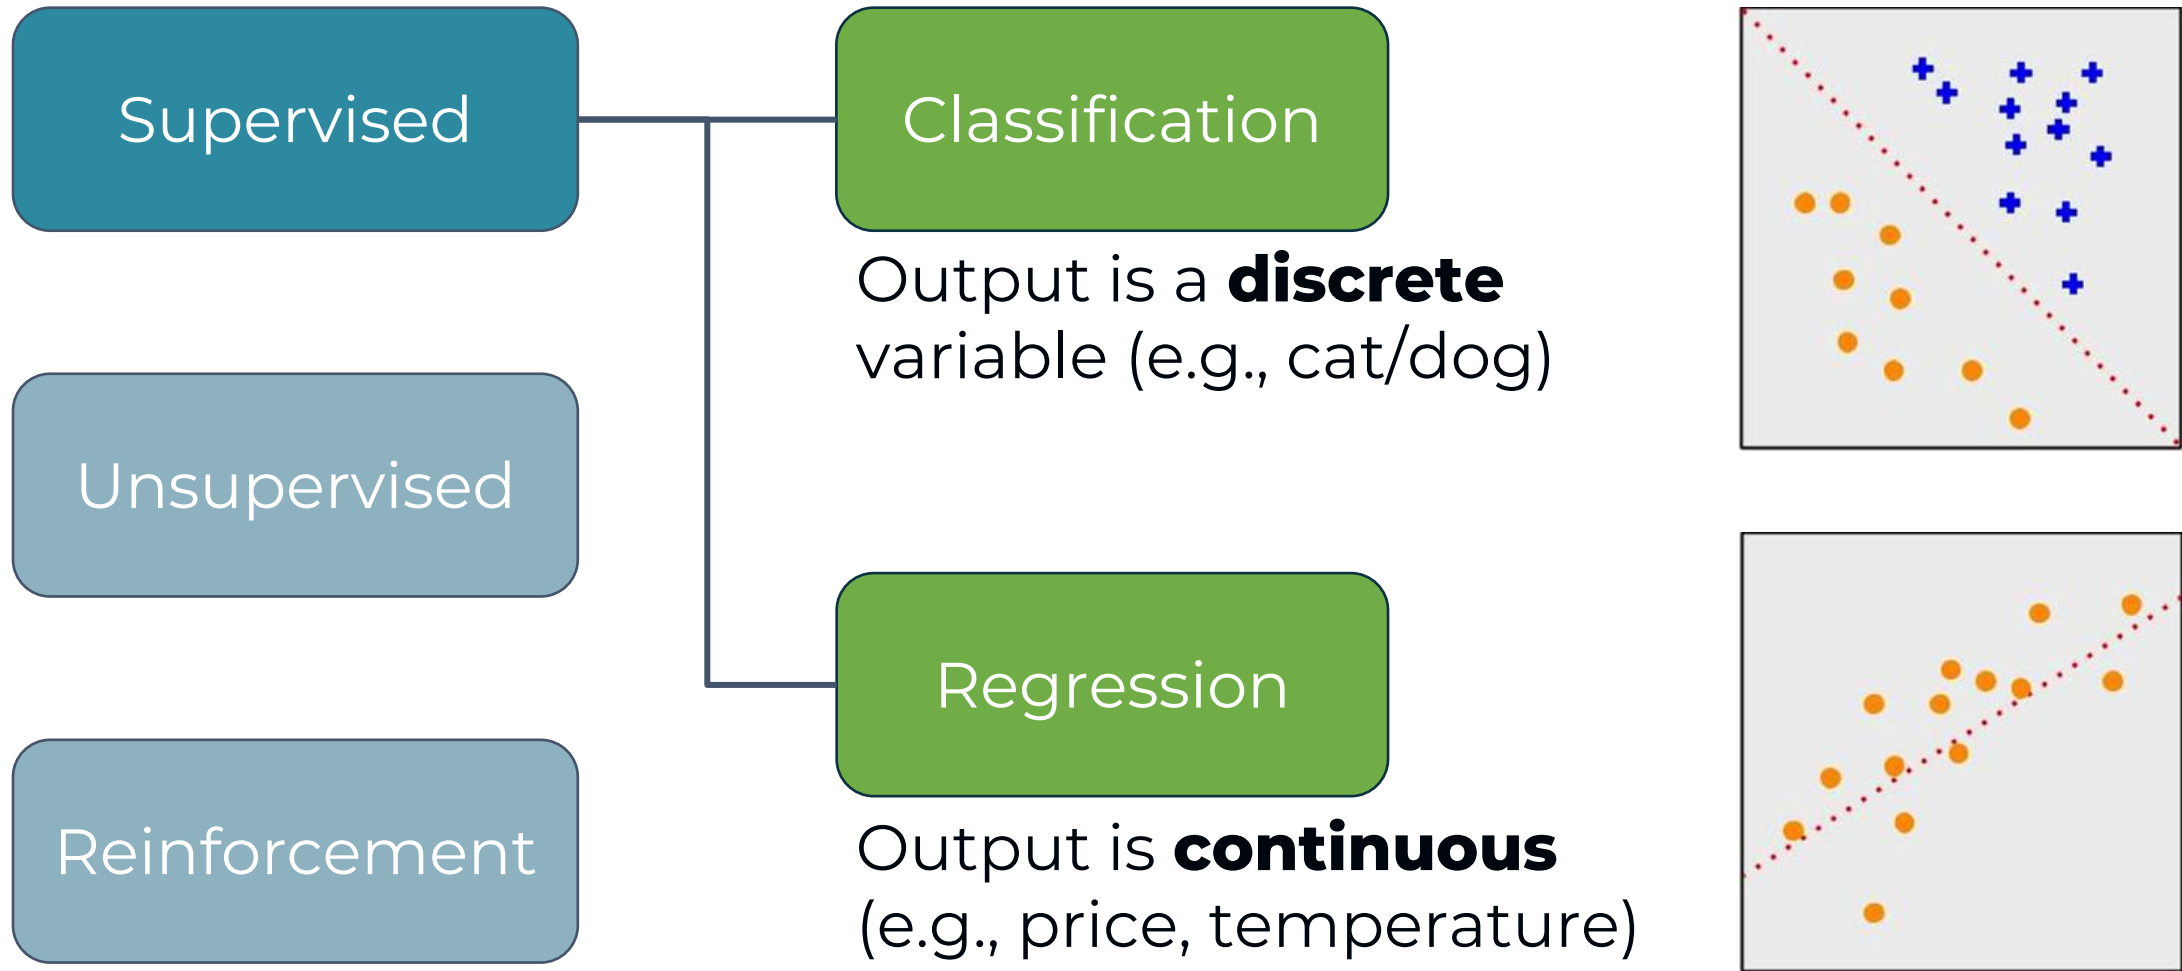

Are these emails spam or not?

Predict the market value of houses, given the square meters, number of rooms, neighborhood, etc.

Reinforcement

Introduction to Machine Learning

Types of Machine Learning problems

Supervised

There is **no desired output**. Learn something about the data. *Latent* relationships.

Unsupervised

I have photos and want to put them in 20 groups.

Reinforcement

I want to find anomalies in the credit card usage patterns of my customers.

Supervised

Useful for learning structure in the data
(clustering), hidden correlations, reduce
dimensionality, etc.

Unsupervised

Reinforcement

Introduction to Machine Learning

Types of Machine Learning problems

Supervised

An agent **interacts** with an **environment** and watches the result of the interaction.

Unsupervised

Environment gives feedback via a positive or negative **reward signal**.

Reinforcement

Introduction to Machine Learning

Steps to solve a Machine Learning problem

Data Gathering

Collect data from various sources

Data Preprocessing

Clean data to have homogeneity

Feature Engineering

Making your data more useful

Algorithm Selection & Training

Selecting the right machine learning model

Making Predictions

Evaluate the model

Might depend on human work

- ▶ Manual labeling for supervised learning.
- ▶ Domain knowledge. Maybe even experts.

May come for free, or “sort of”

- ▶ E.g., Machine Translation.

The more the better: Some algorithms need large amounts of data to be useful (e.g., neural networks).

The **quantity** and **quality** of data dictate the model **accuracy**

Is there anything **wrong** with the data?

- ▶ Missing values
- ▶ Outliers
- ▶ Bad encoding (for text)
- ▶ Wrongly-labeled examples
- ▶ Biased data

Do I have many more samples from one class than the rest?

Need to fix/remove data?

Our inputs are represented by a **set of features**.

A feature is an individual measurable property of a phenomenon being observed

To classify spam email, features could be:

- ▶ Number of words that have been *ch4ng3d* like this.
- ▶ Language of the email (0=English, 1=Spanish)
- ▶ Number of emojis

*Buy ch34p drugs
from the ph4rm4cy
now :) :) :)*

Feature
engineering

(2, 0, 3)

Extracts **more** information from **existing** data, doesn't add “new” data

- ▶ Making it more **useful**
- ▶ With good features, most algorithms can learn **faster**

It can be an art

- ▶ Requires thought and knowledge of the data

Two steps:

- ▶ Variable transformation (e.g., dates into weekdays, normalizing)
- ▶ Feature creation (e.g., n-grams for texts, if word is capitalized to detect names)

Supervised

- ▶ Linear classifier
- ▶ Naive Bayes
- ▶ Support Vector Machines (SVM)
- ▶ Decision Tree
- ▶ Random Forests
- ▶ k-Nearest Neighbors
- ▶ **Neural Networks (Deep learning)**

Unsupervised

- ▶ PCA
- ▶ t-SNE
- ▶ k-means
- ▶ DBSCAN

Reinforcement

- ▶ SARSA- λ
- ▶ Q-Learning

Goal of training: make the correct prediction as often as possible

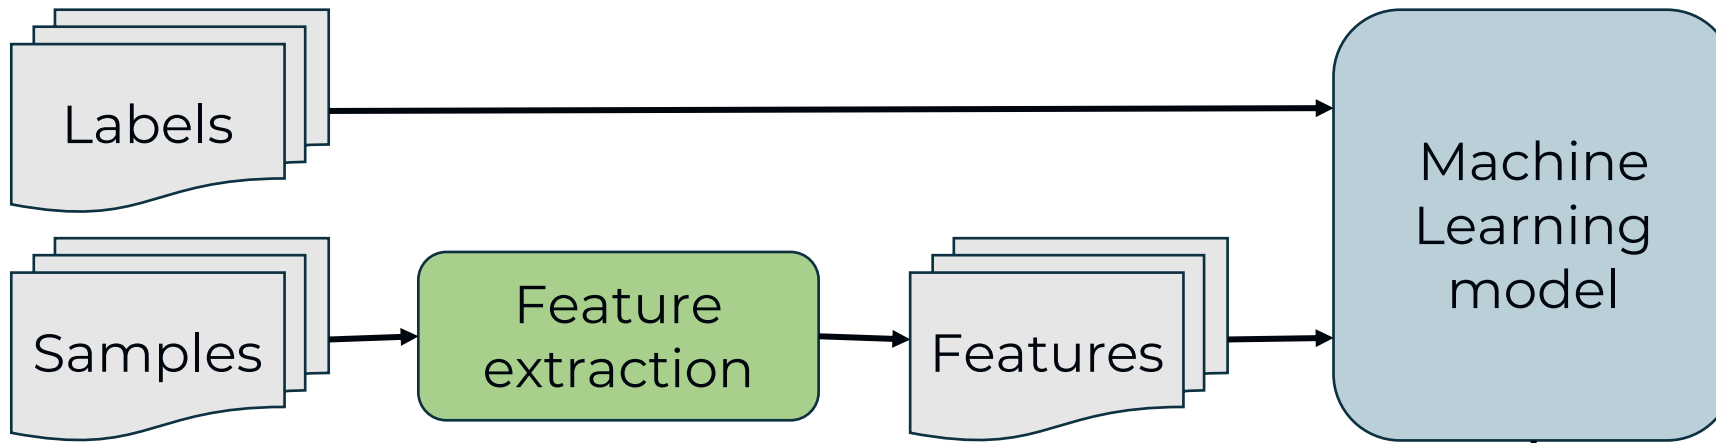

► Incremental improvement:

► Metrics for **evaluating** performance and comparing solutions.

► **Hyperparameter tuning:** more an art than a science

Training phase

Prediction phase

- ▶ Machine Learning is intelligent **use of data** to **answer questions**
- ▶ Enabled by an **exponential** increase in computing power and data availability
- ▶ Three big types of problems: **supervised, unsupervised, reinforcement**

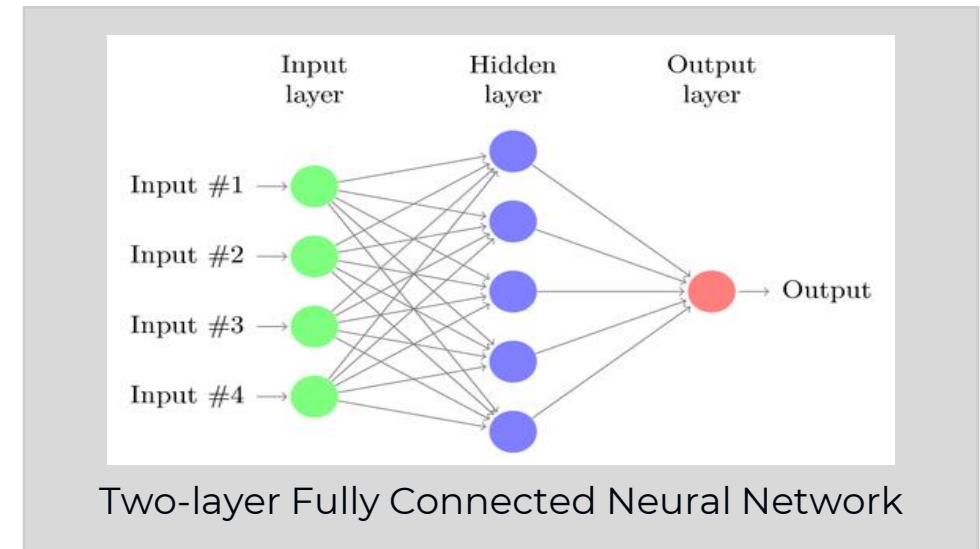

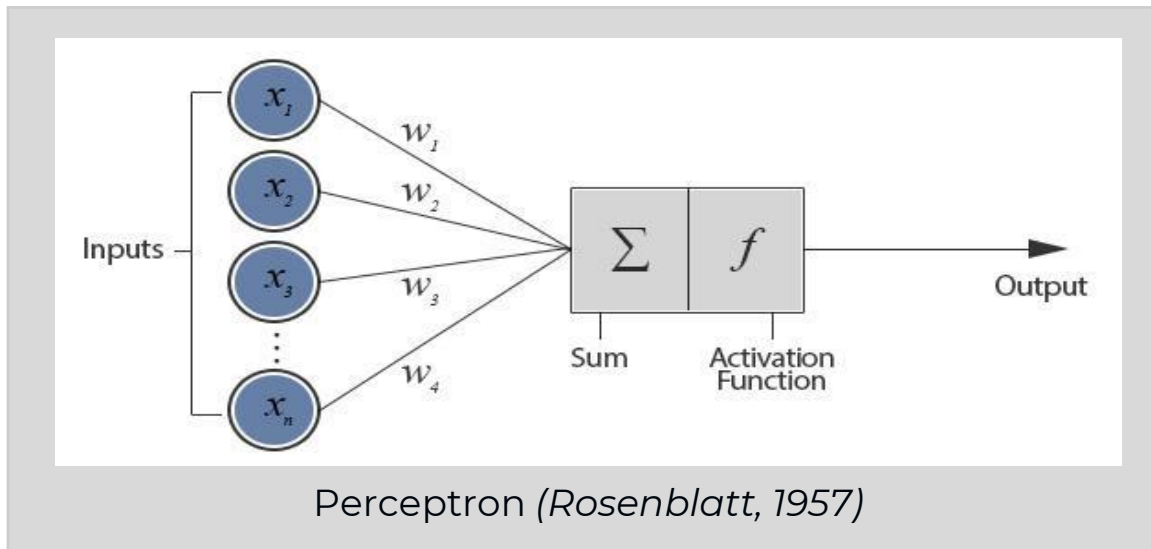

5 steps to **every** machine learning solution:

1. Data Gathering
2. Data Preprocessing
3. Feature Engineering
4. Algorithm Selection & Training
5. Making Predictions

Deep Learning

“Any sufficiently advanced technology is indistinguishable from magic.” (Arthur C. Clarke)

- ▶ First model of artificial neural network proposed in **1943**
- ▶ Analogy to the *human brain* greatly exaggerated
- ▶ Given some inputs (x), the network calculates some outputs (y) using a set of weights (w)

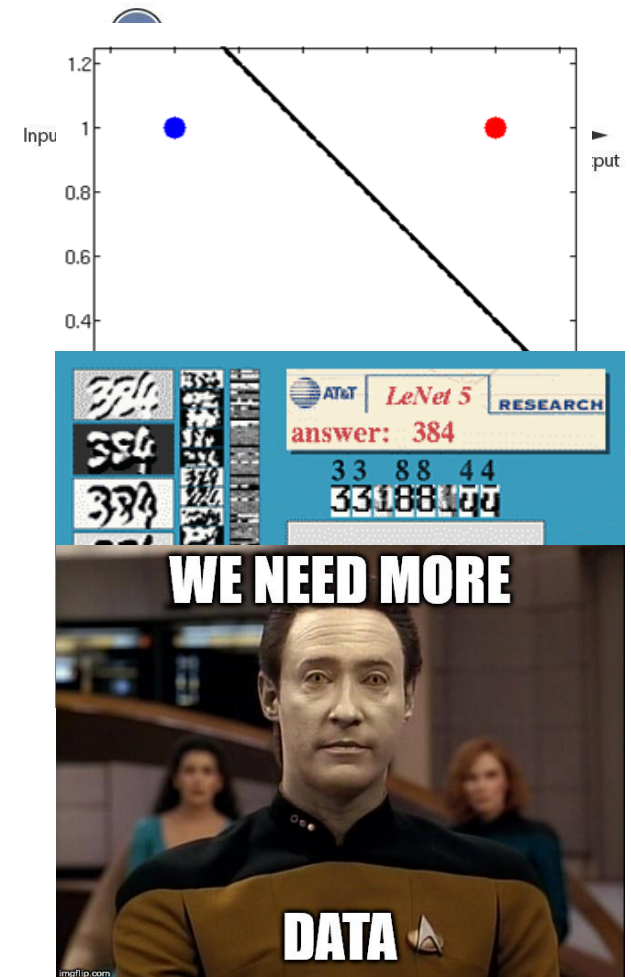

- ▶ Weights must be adjusted (**learned** from the data)
- ▶ Idea: define a function that tells us **how “close”** the network is to generating the desired output
- ▶ **Minimize** the loss → **optimization** problem
- ▶ With a **continuous** and **differentiable** loss function, we can apply **gradient descent**

Deep Learning

The rise, fall, rise, fall and rise of Neural Networks

- ▶ Perceptron gained popularity in the 60s
 - ▶ Belief that would lead to true AI
- ▶ XOR problem and AI Winter (1969 – 1986)
- ▶ Backpropagation to the rescue! (1986)
 - ▶ Training of multilayer neural nets
 - ▶ LeNet-5 (Yann LeCun et al., 1998)
- ▶ Unable to scale. Lack of good data and processing power

Deep Learning

The rise, fall, rise, fall and rise of Neural Networks

- ▶ Regained popularity since ~2006.
 - ▶ Train each layer at a time
 - ▶ Rebranded field as **Deep Learning**
 - ▶ Old ideas rediscovered (e.g., Convolution)
- ▶ Breakthrough in 2012 with AlexNet (Krizhevsky et al.)
 - ▶ Use of GPUs
 - ▶ Convolution

Image classification with Deep Neural Networks

The convolution operator

Input

Kernel

Feature Map

Image classification with Deep Neural Networks

The convolution operator

Image classification with Deep Neural Networks

The convolution operator

- ▶ Takes spatial dependencies into account
- ▶ Used as a **feature extraction** tool
- ▶ **Differentiable** operation → the kernels can be **learned**

Traditional ML

Deep Learning

Increment the network's **capacity**

- Convolution, matrix multiplication and summation are linear

Sigmoid

$$f(x) = \frac{1}{1 + e^{-x}}$$

Hyperbolic tangent

$$\tanh(x) = \frac{e^{2x-1}}{e^{2x+1}}$$

ReLU

$$f(x) = \max(0, x)$$

Image classification with Deep Neural Networks

Non-linear activation functions

Image classification with Deep Neural Networks

The pooling operation

- ▶ Used to reduce dimensionality
- ▶ Most common: **Max pooling**
- ▶ Makes the network invariant to small **transformations**, **distortions** and **translations**.

Image classification with Deep Neural Networks

Putting all together

Image classification with Deep Neural Networks

Training Convolutional Neural Networks

Image classification is a **supervised problem**

- ▶ Gather images and **label** them with desired output
- ▶ Train the network with **backpropagation!**

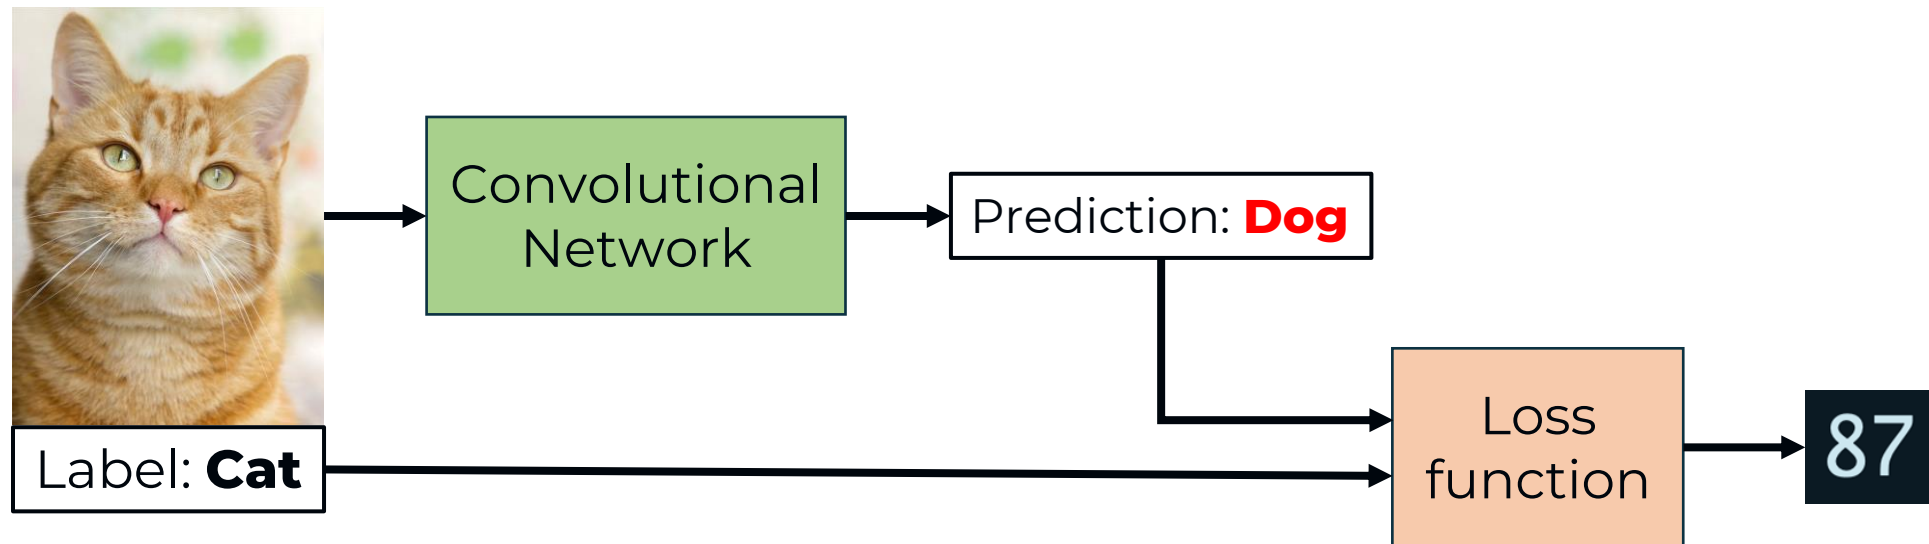

Image classification with Deep Neural Networks

Training Convolutional Neural Networks

Image classification is a **supervised problem**

- ▶ Gather images and **label** them with desired output
- ▶ Train the network with **backpropagation!**

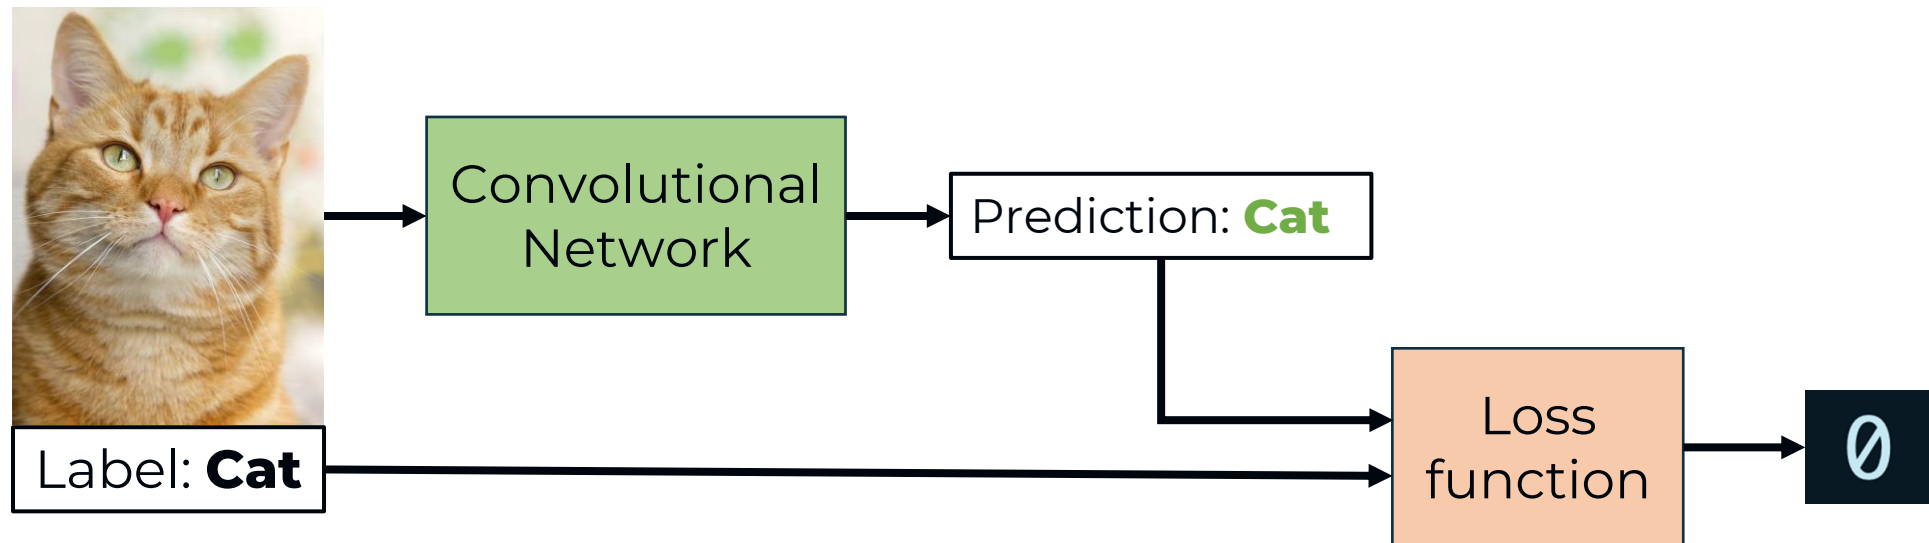

Image classification with Deep Neural Networks Surpassing human performance

Abstract

We trained a large, deep convolutional neural network to classify the 1.2 million high-resolution images in the ImageNet LSVRC-2010 contest into the 1000 different classes. On the test data, we achieved top-1 and top-5 error rates of 37.5% and 17.0% which is considerably better than the previous state-of-the-art. The neural network, which has 60 million parameters and 650,000 neurons, consists of five convolutional layers, some of which are followed by max-pooling layers, and three fully-connected layers with a final 1000-way softmax. To make training faster, we used non-saturating neurons and a very efficient GPU implementation of the convolution operation. To reduce overfitting in the fully-connected

Power

Players

Conclusions

Machine learning algorithms learn from data to find hidden relations, to make predictions, to interact with the world, ...

A machine learning algorithm is as good as its input data

Good model + Bad data = Bad Results

Deep learning is making significant breakthroughs in: speech recognition, language processing, computer vision, control systems, ...

If you are not using or considering using Deep Learning to understand or solve vision problems, **you almost certainly should try it**
