Introduction to Deep Learning and Visual AI: Fundamentals and Architectures

Mohammad Haghighat

Senior Manager, CoreAI

eBay

Outline

- High level introduction to AI
  - Classical vs. deep learning
- Neural networks and deep learning
  - Fully connected networks
  - Elements of a neural network
  - Neural network training
- Convolutional neural networks (CNNs)
  - Building blocks of CNNs
- CNNs (cont.)
  - Applications of CNNs
  - Popular CNN architectures
  - Mobile CNN architectures
- Attention mechanism
  - Vision transformers
  - CNN vs ViT
- Conclusions

High-level introduction to AI

Machine Learning (ML) Model

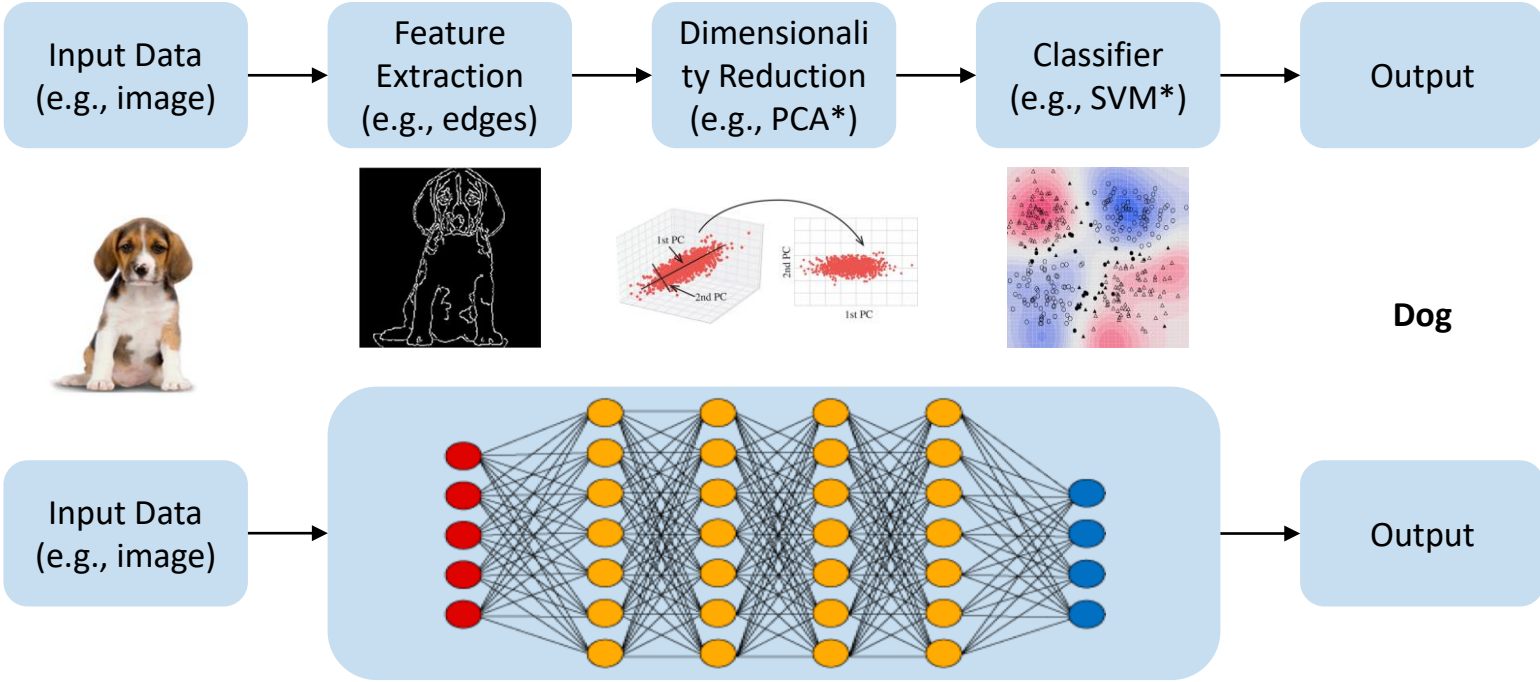
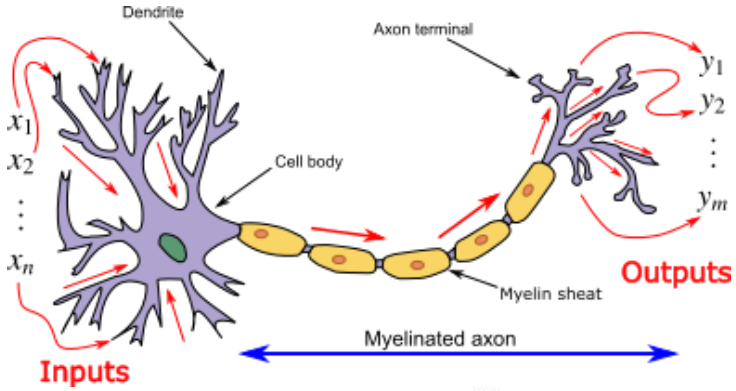
"Let's go for lunch"

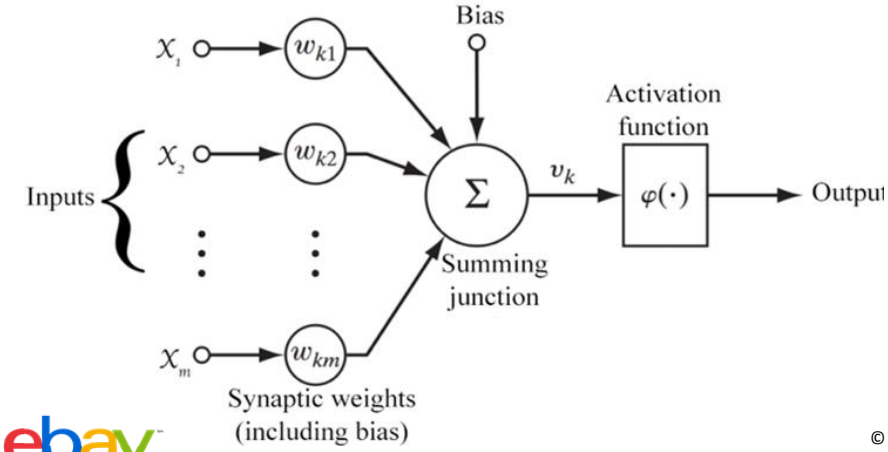
Classical learning vs deep learning

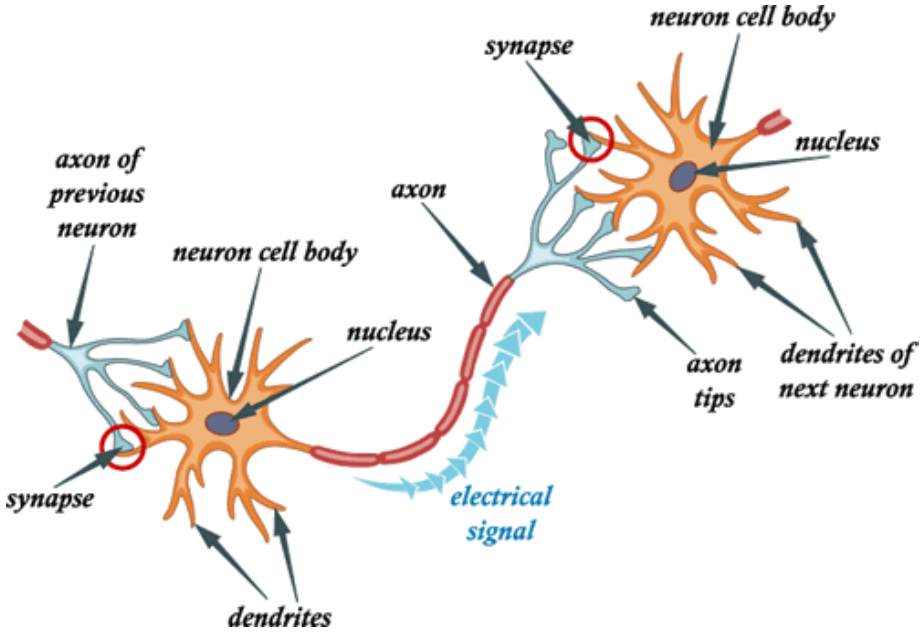


*PCA: Principal Component Analysis
*SVM: Support Vector Machines

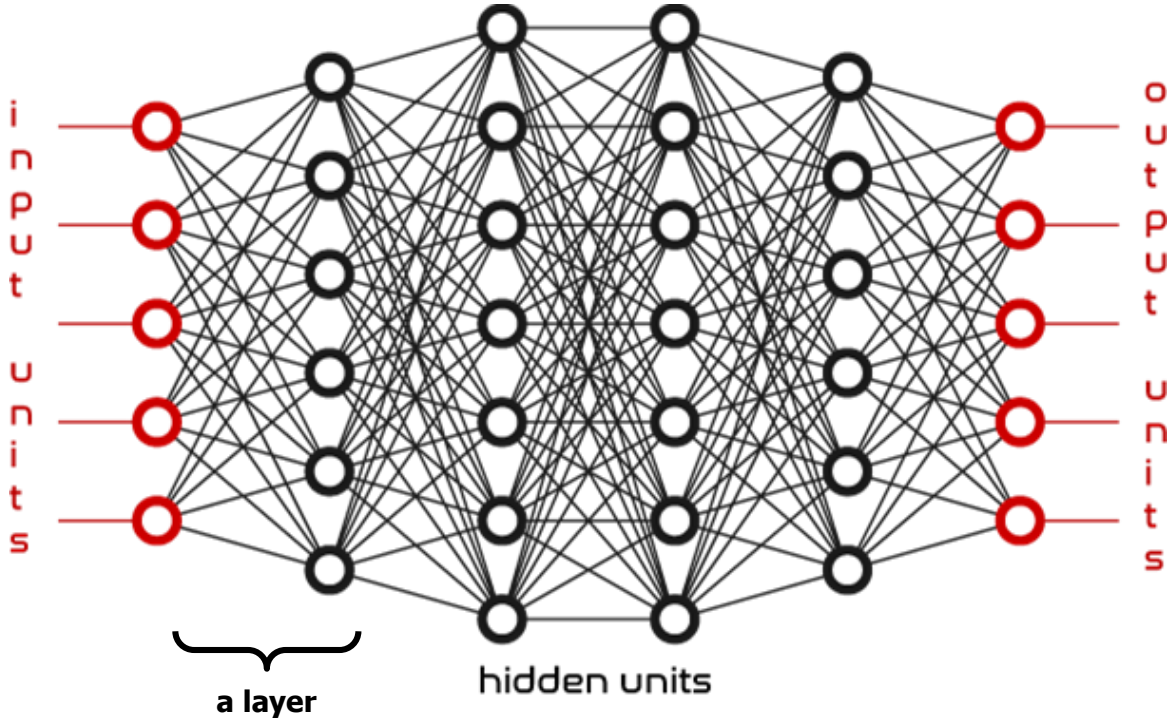
What are neurons?







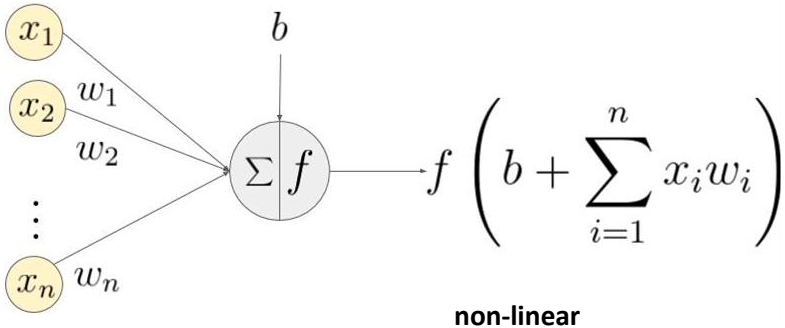
… and what are neural networks?



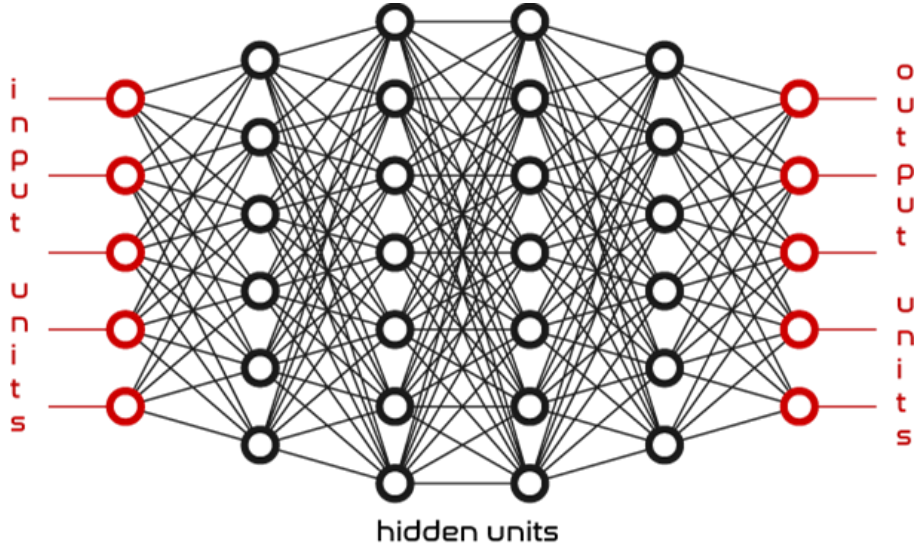
Neural networks as a vehicle for deep learning

Universal Approximation Theorem

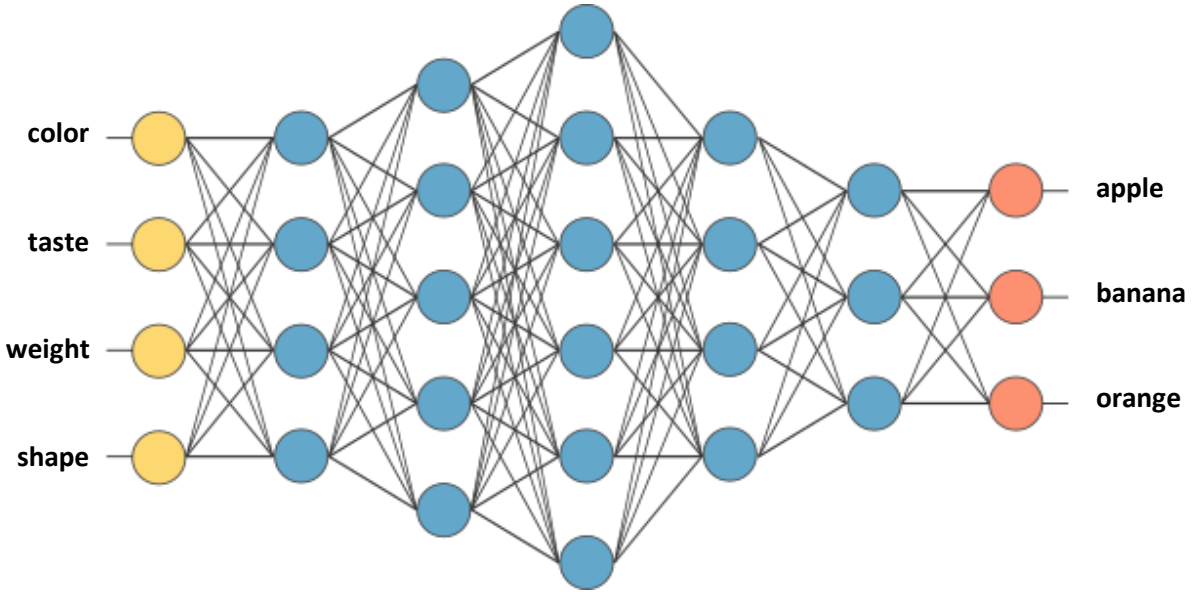
A one-hidden-layer neural network with enough neurons can approximate ***any*** continuous function within the given input range.



non-linear
activation function



Neural network-based classifier

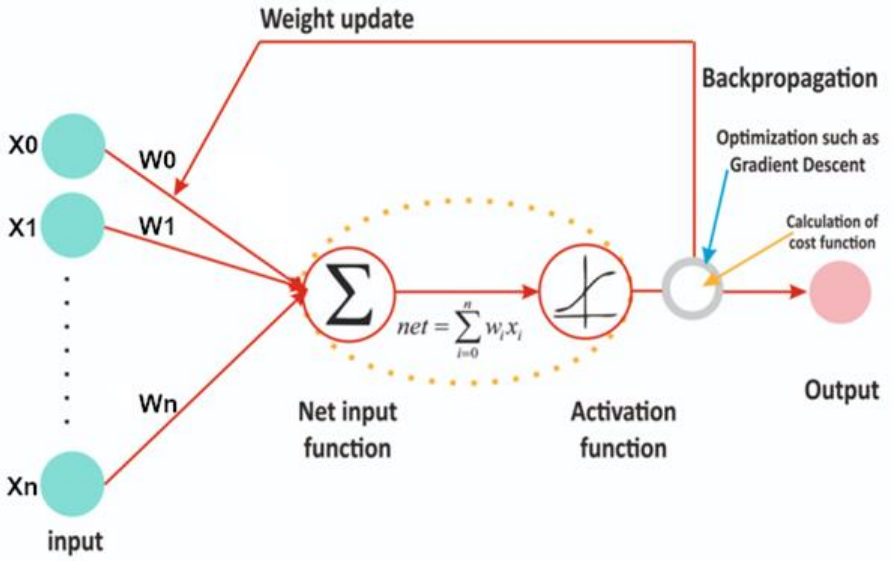


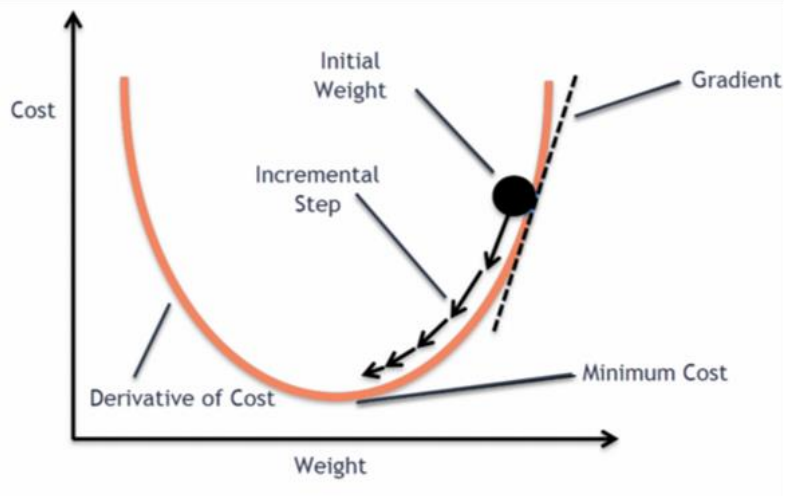
network output	ideal output
0.12	0
0.05	0
0.83	1

error/loss

Neural network training

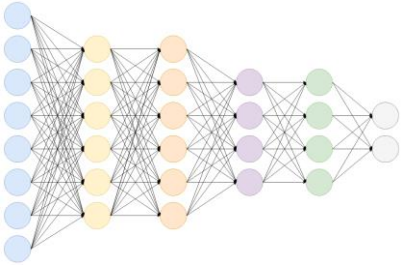
Loss and gradient descent algorithm





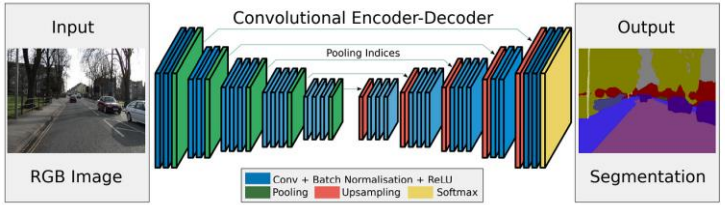
Different model types and architectures

Fully Connected Networks



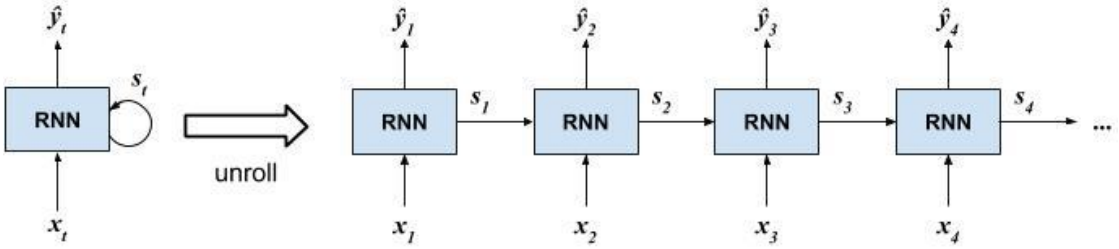
Convolutional Neural Networks

- Encoders
- UNETs
- 3D CNNs



Sequential Approaches

- RNNs
- LSTMs
- GRUs



Attention-based Networks

- Transformers

Image as an input data

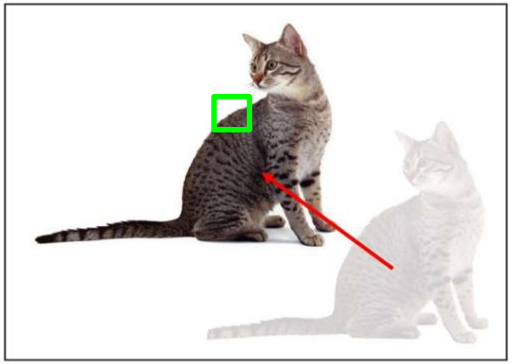
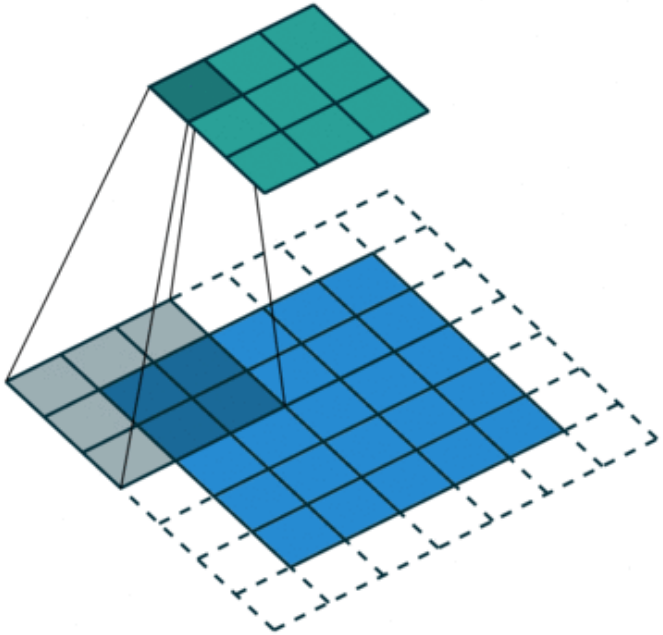
How computer sees an edge

Convolutional vs fully connected

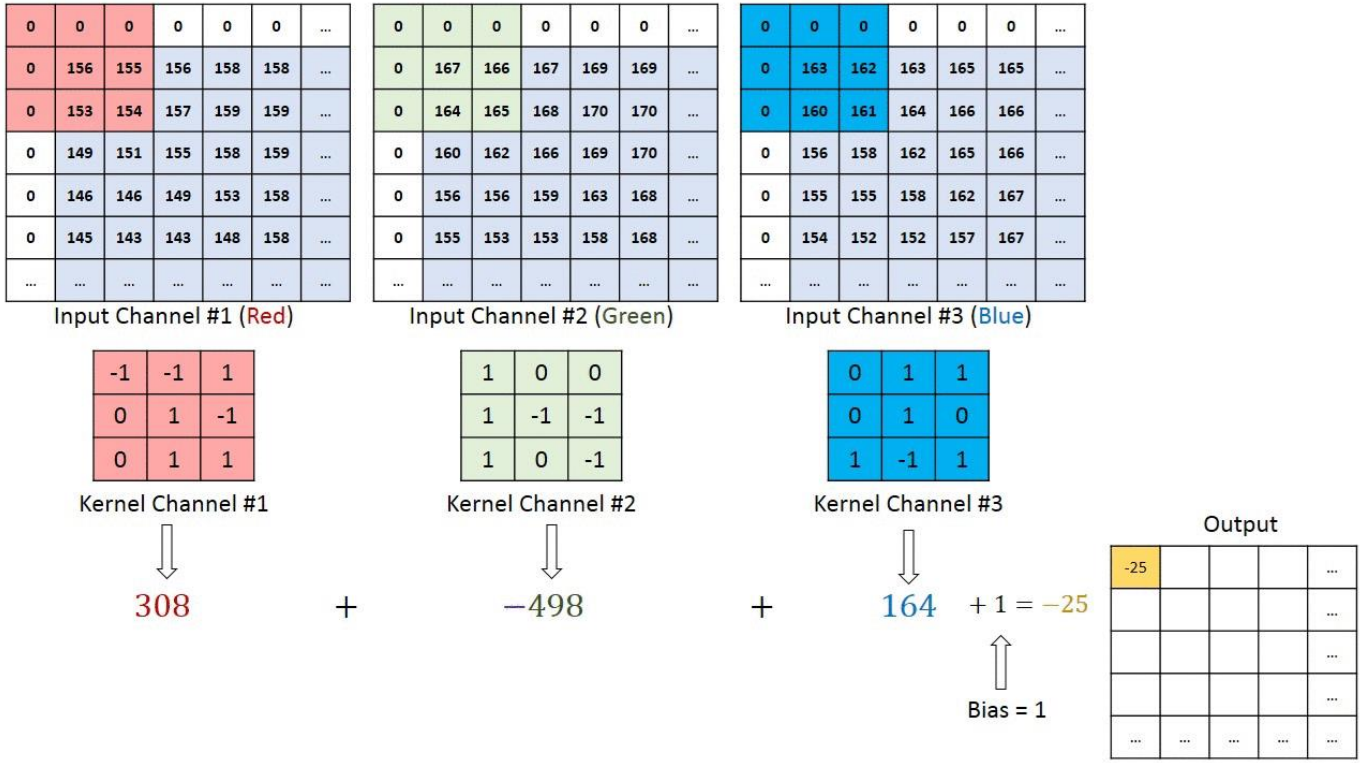
Convolutional layer

- Capture local patterns and spatial relationships between pixels
- Parameter efficiency: shared weights
- Better generalization: translation invariance

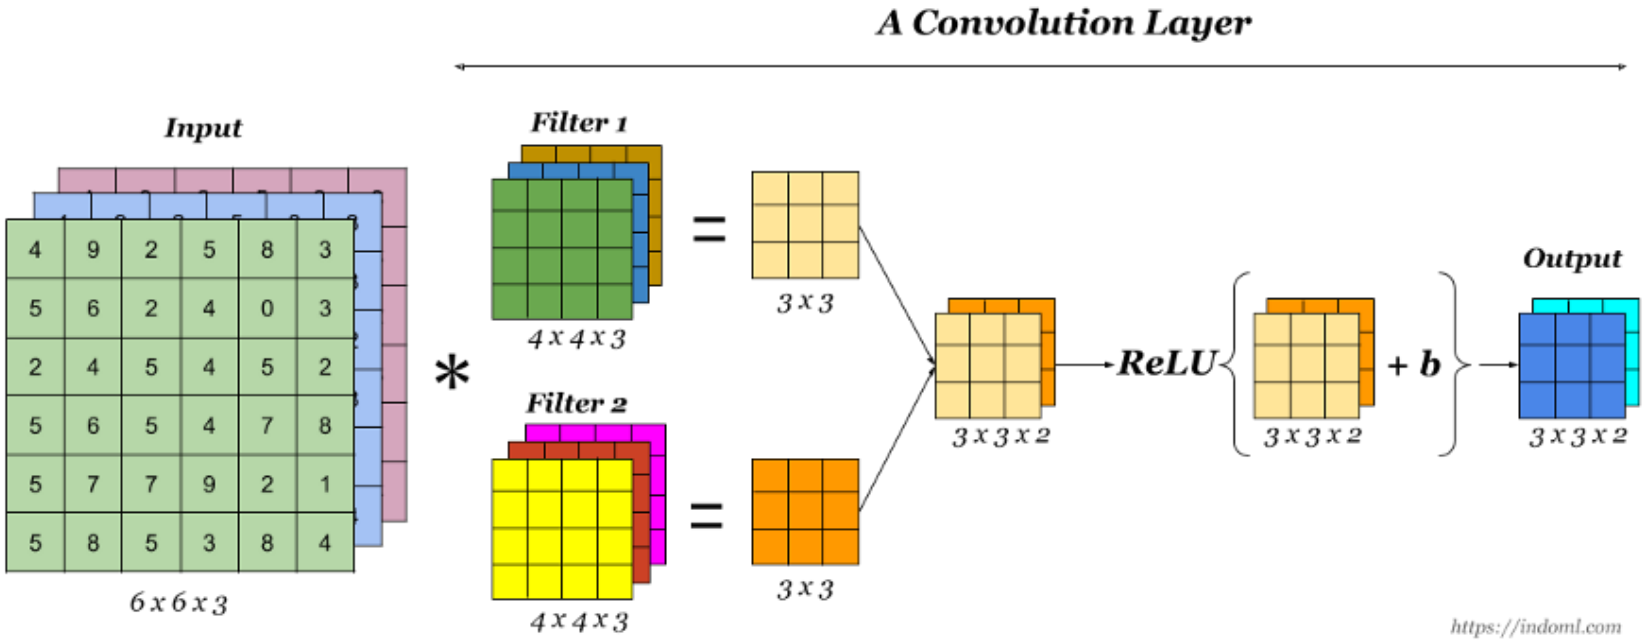




Introduction to CNNs



Building blocks of CNNs

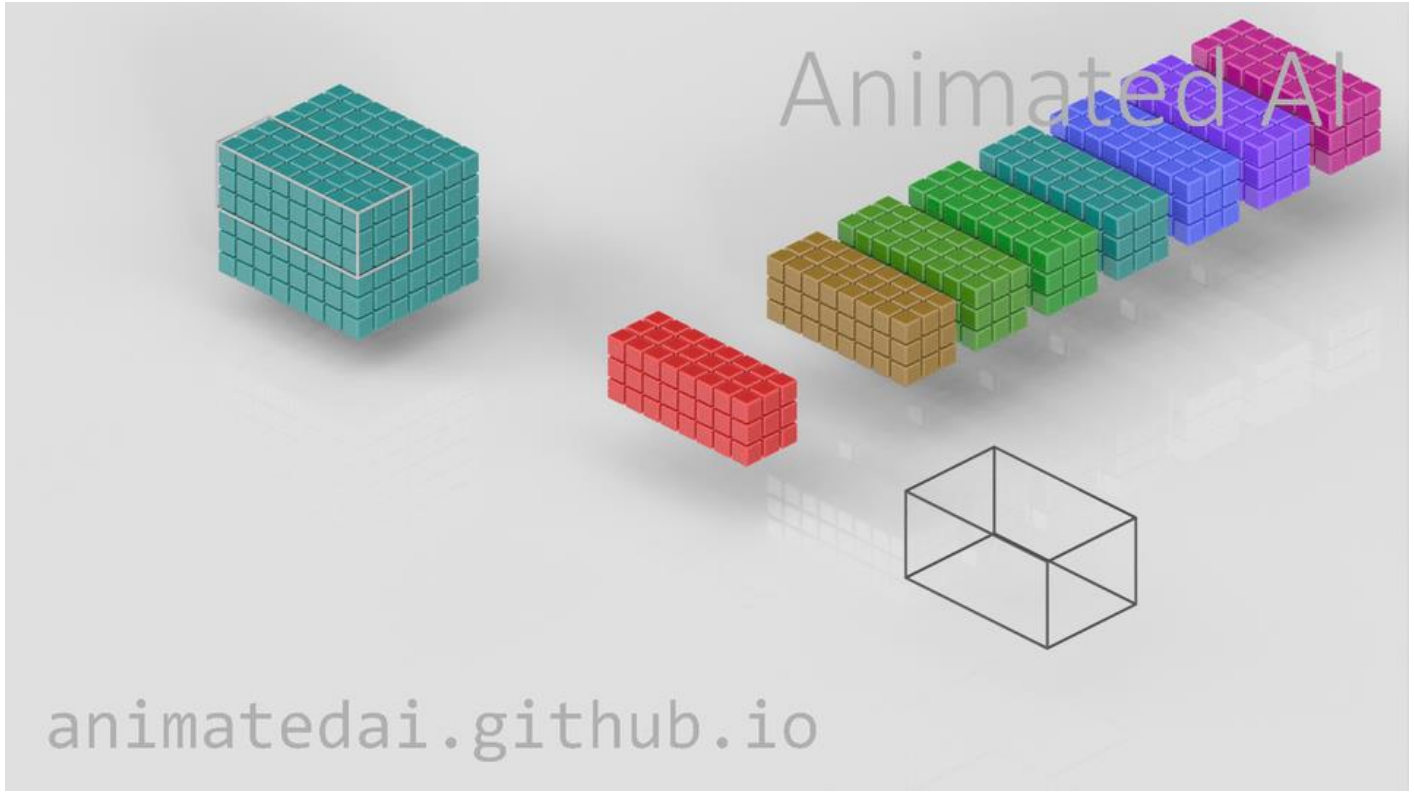


Number of parameters in a convolutional layer

Number of parameters for a K×K kernel:

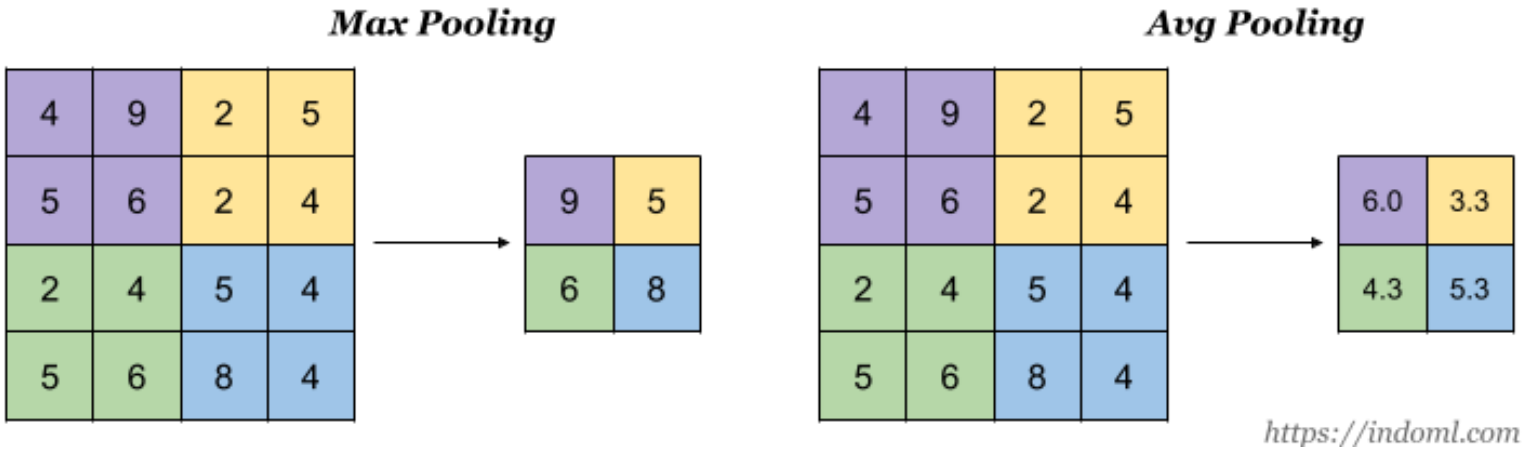
$(K \times K \times N + 1) \times M$

N: input depth
M: output depth



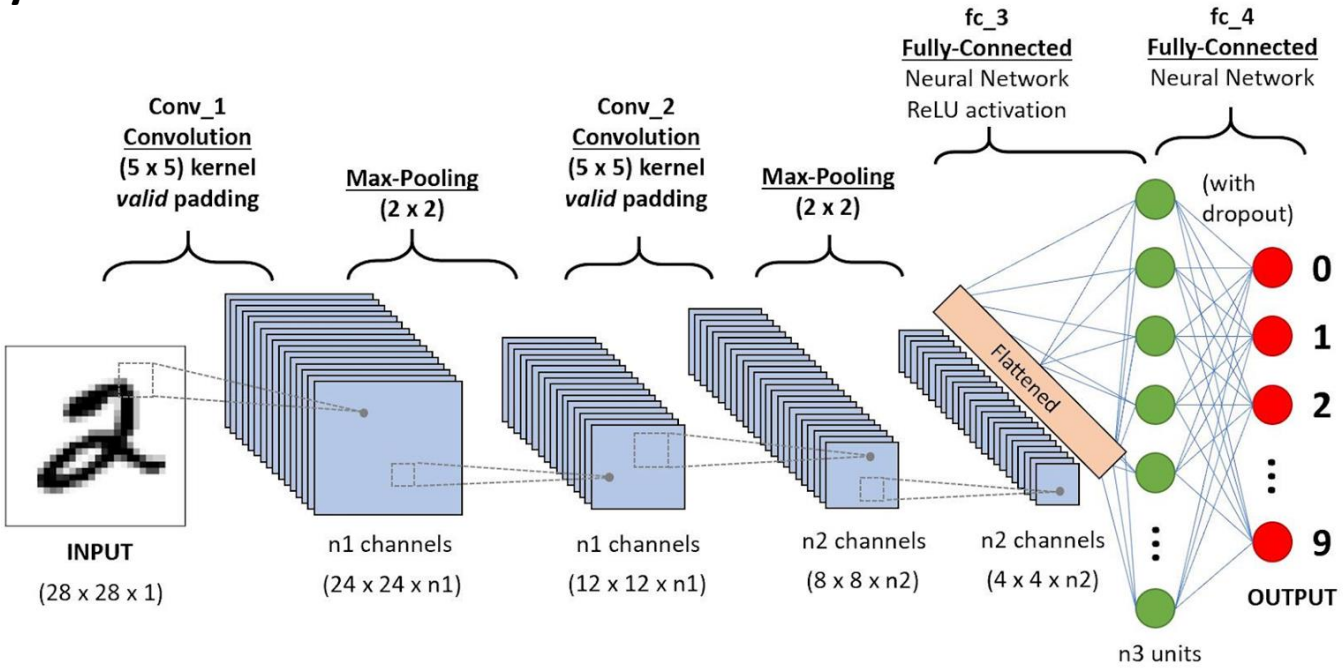
Building blocks of CNNs

Pooling layer



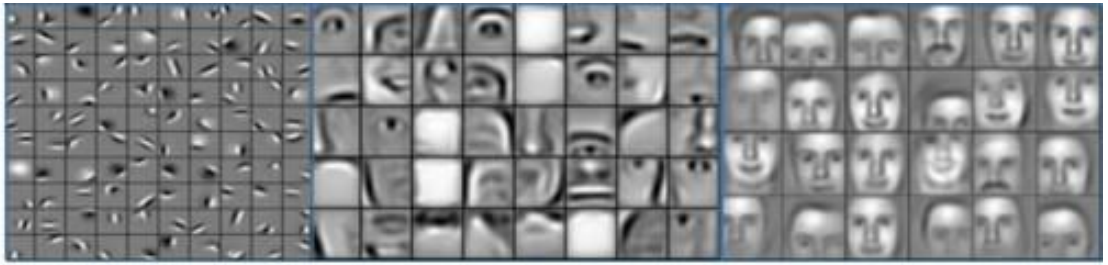
Building blocks of CNNs

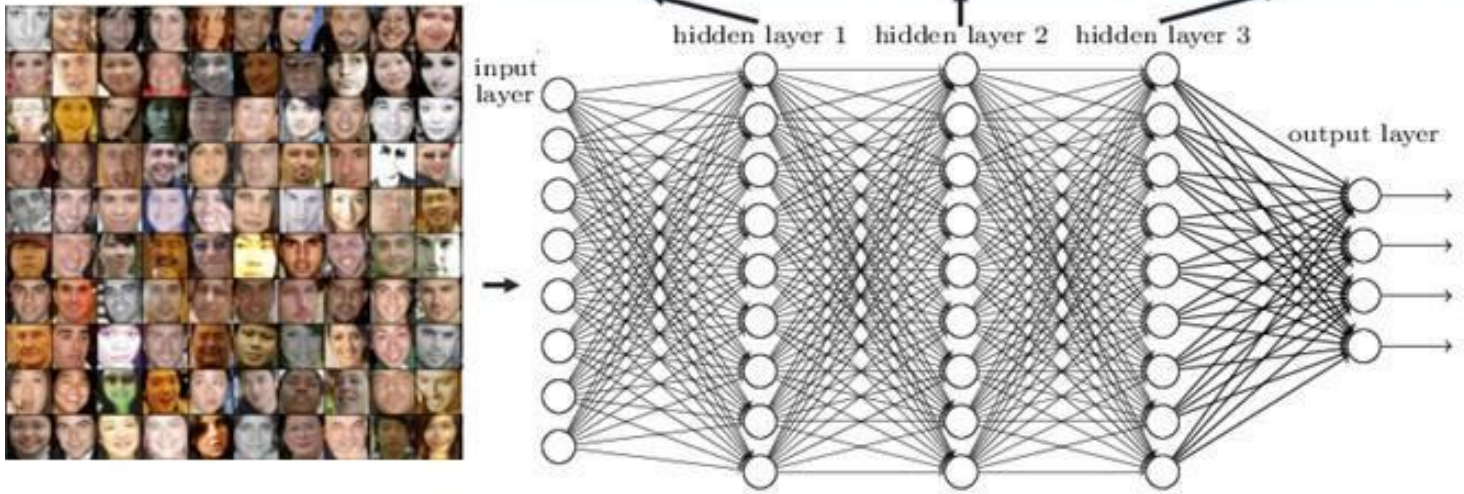
A Multi-Layer CNN



Deep learning is representation learning (a.k.a. feature learning)

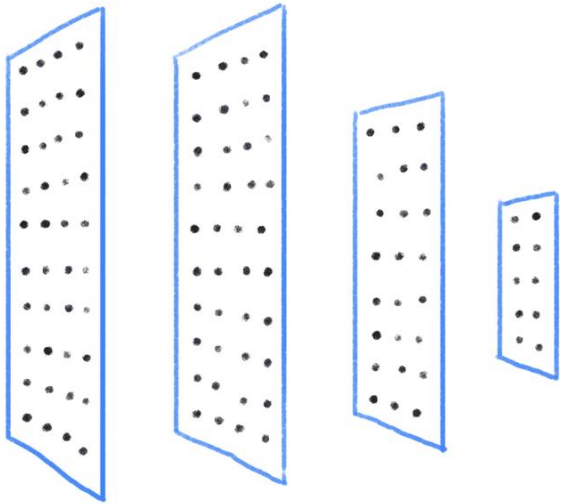
Deep neural networks learn hierarchical feature representations





Applications of CNNs

Image Classification

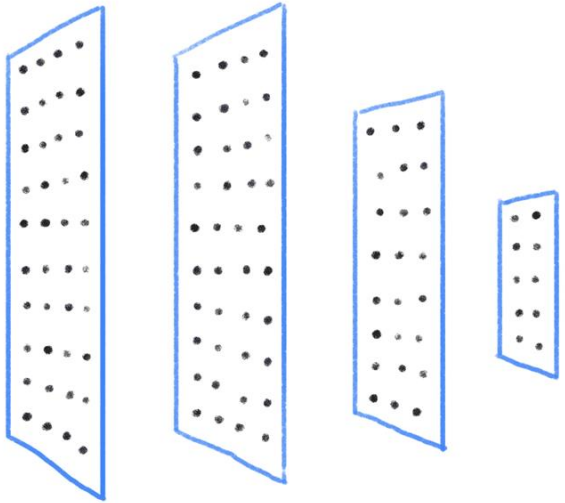


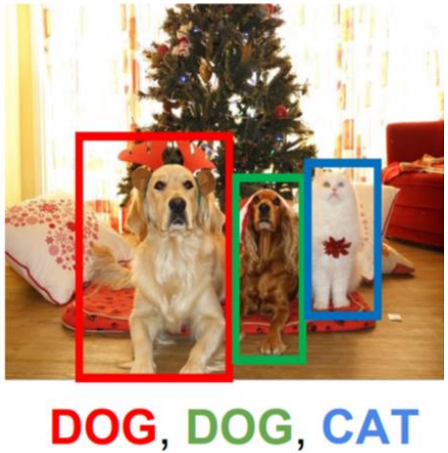
$P_{dog} = 0.9$

$P_{cat} = 0.1$

Applications of CNNs

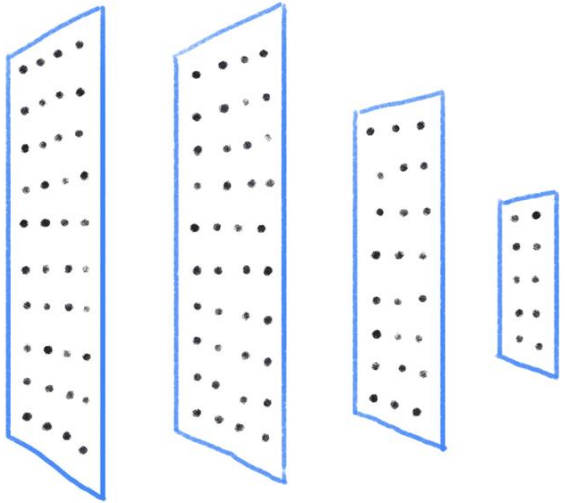
Object Detection





Applications of CNNs

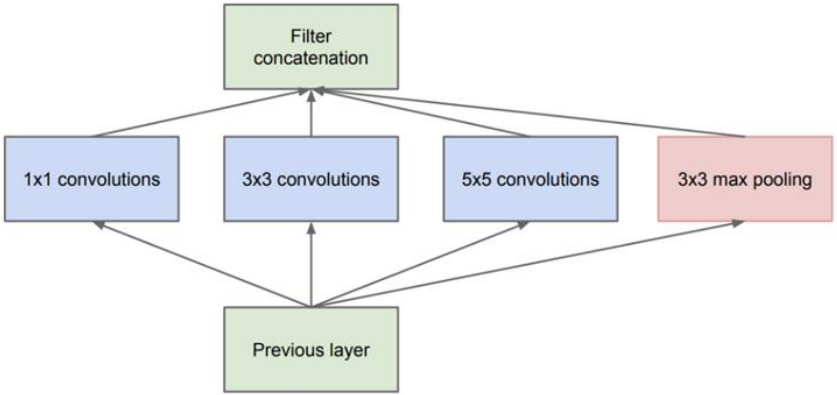
Instance Segmentation



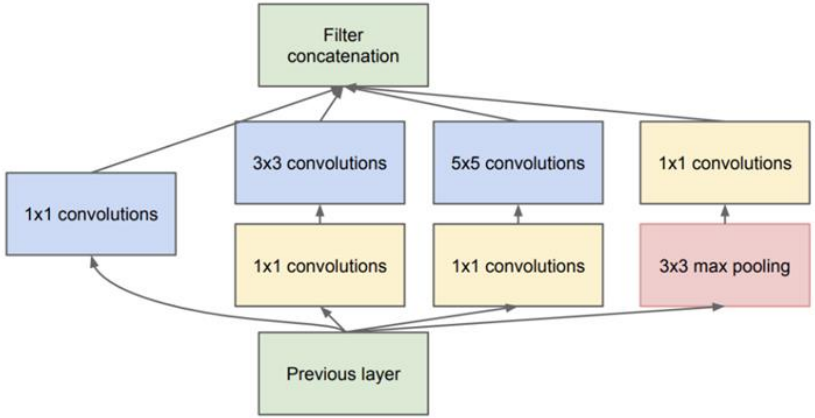
Popular CNN architectures

Inception (2014)

Motivation: let the network decide what filter size to put in a layer



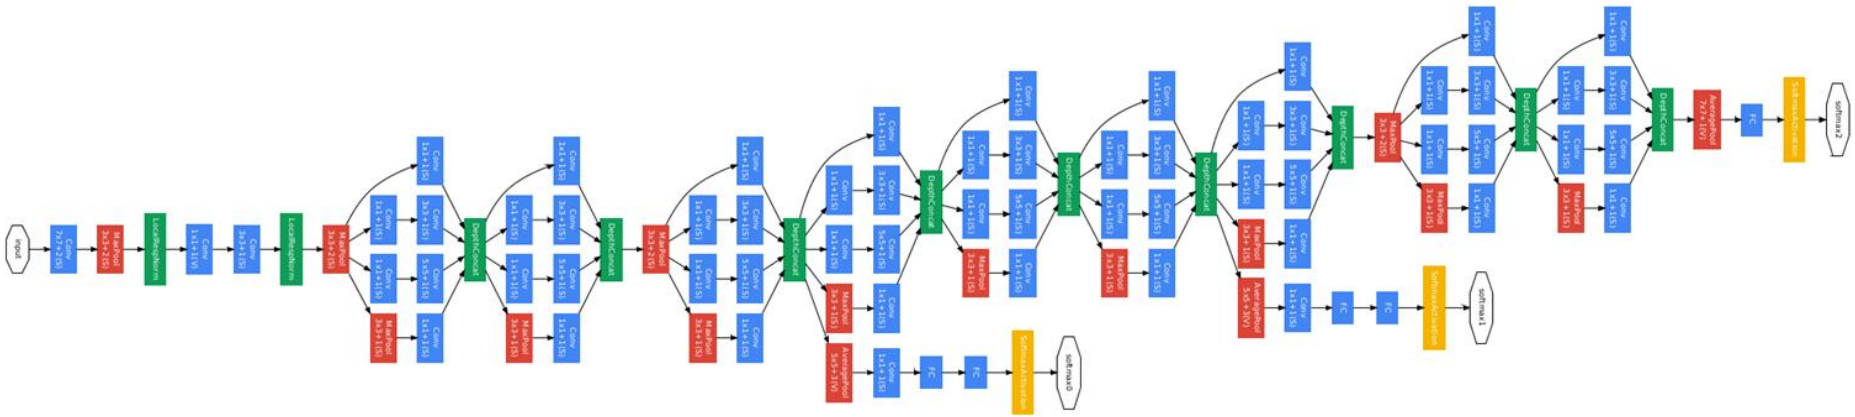
(a) Inception module, naïve version



(b) Inception module with dimension reductions

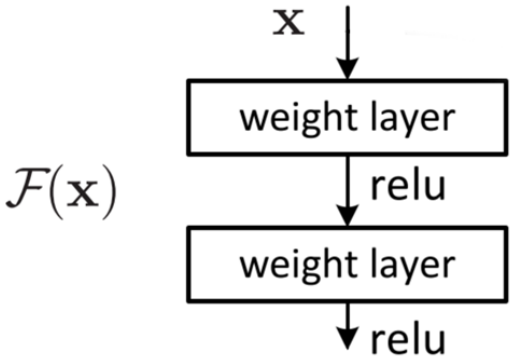
Popular CNN architectures

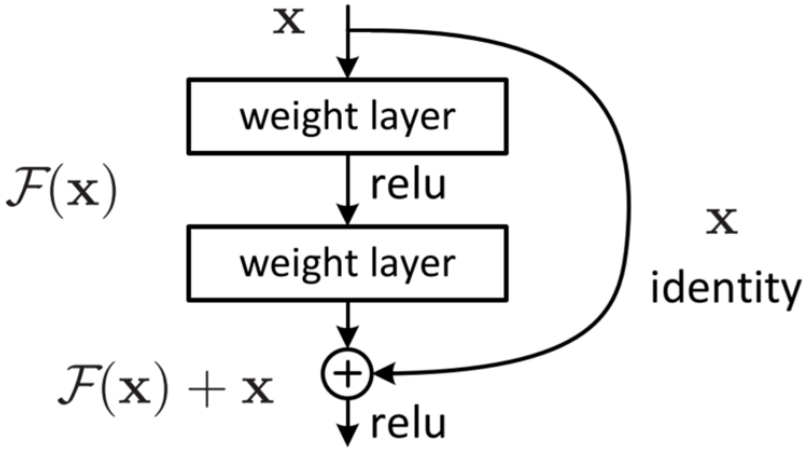
GoogleNet (2014) - Top-5 Error 6.67% on ImageNet



Popular CNN architectures

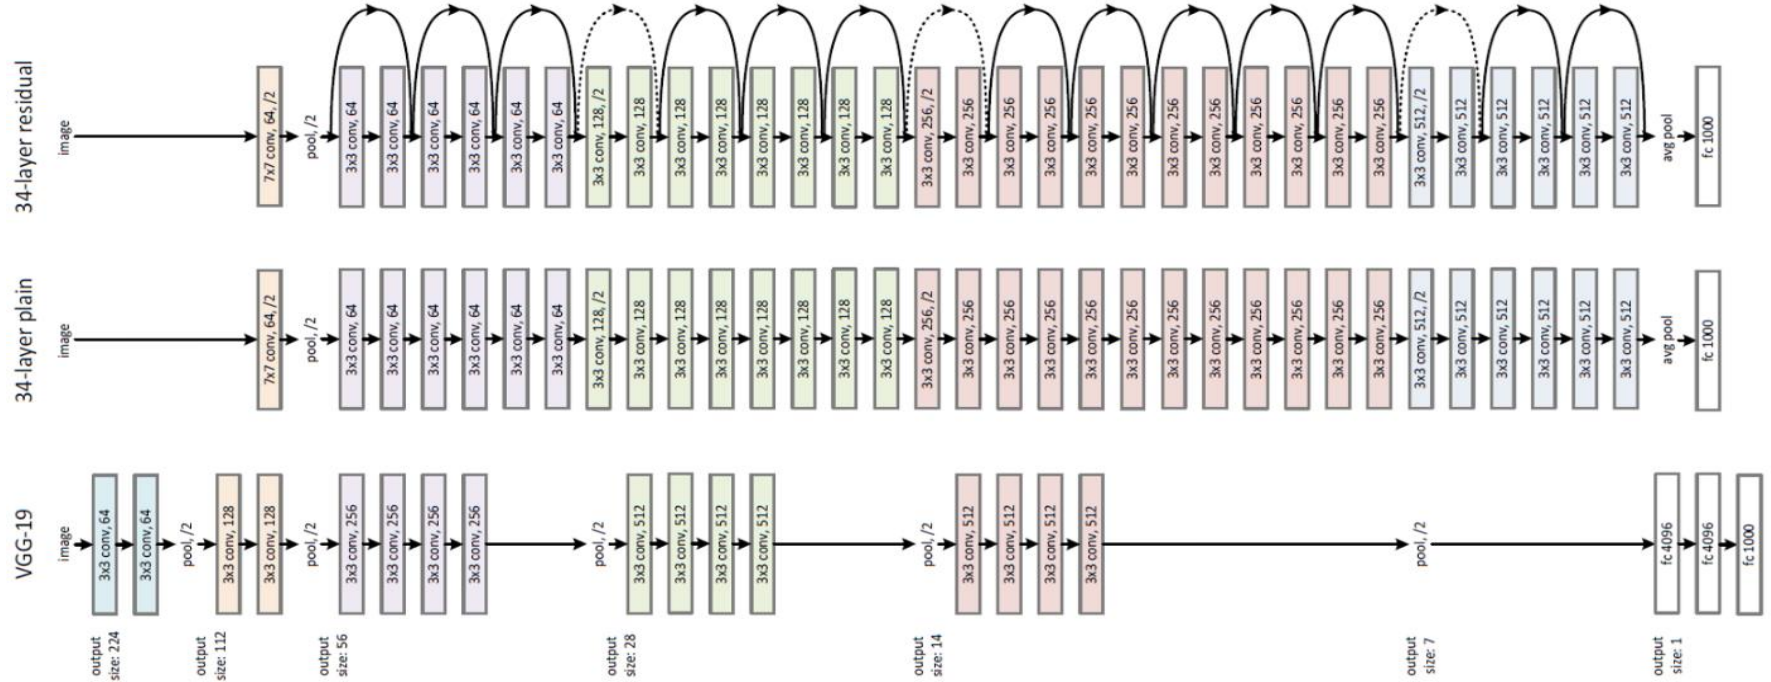
Residual block with a skip connection



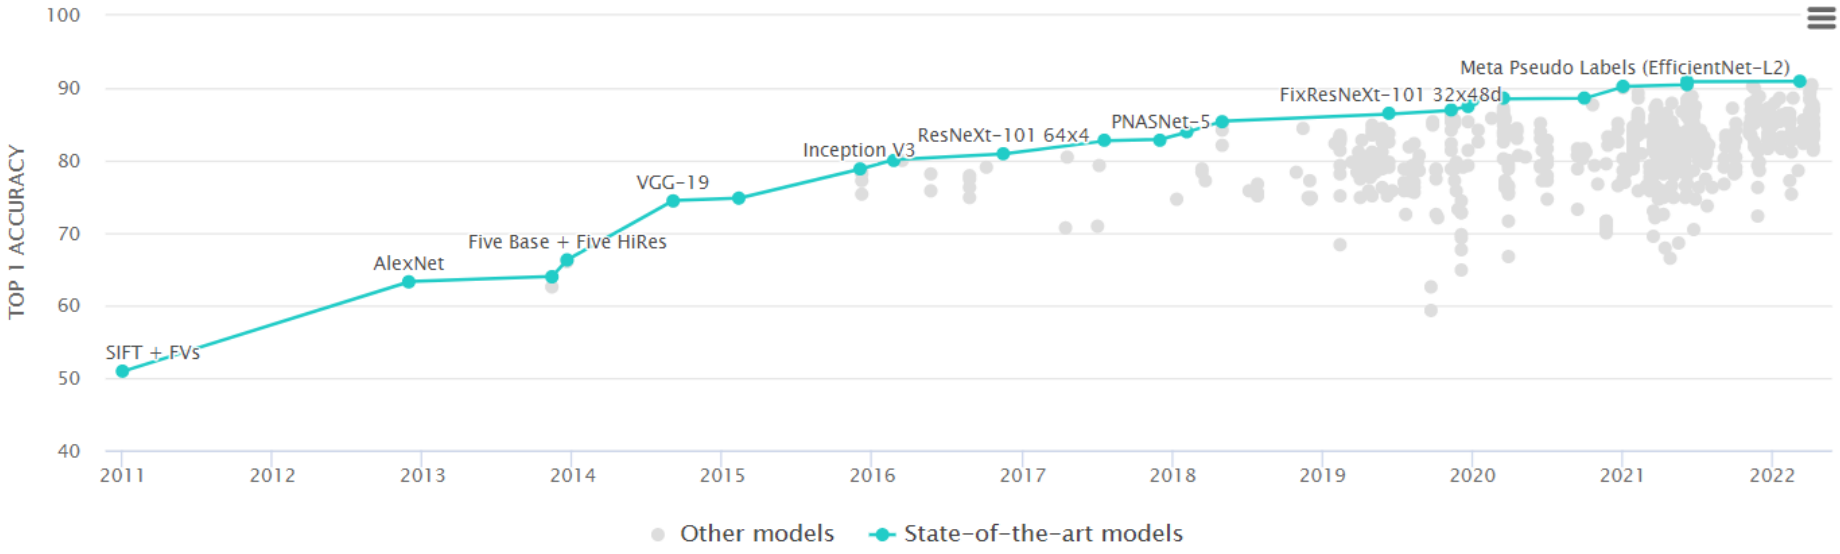


Popular CNN architectures

ResNet (2015) – Top-5 Error 3.57% on ImageNet for ResNet-152

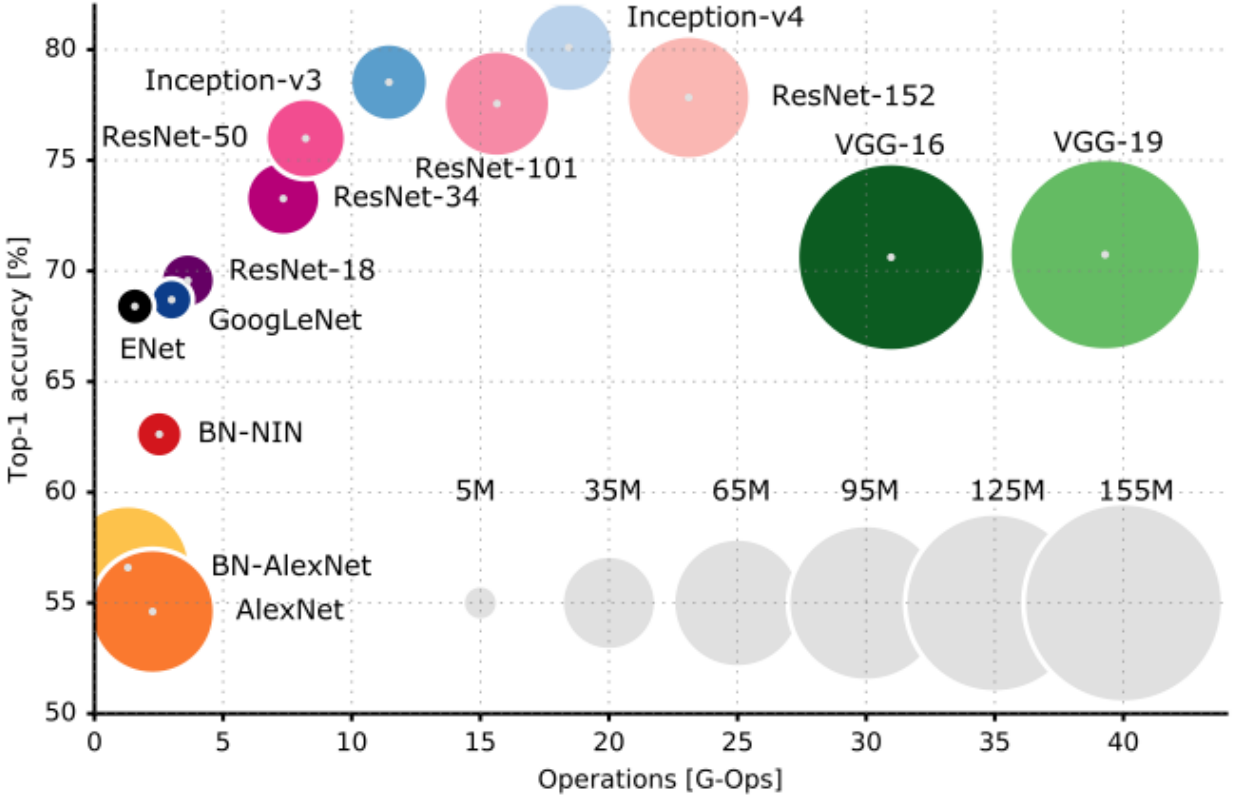


Trend of CNN-based classifiers



https://paperswithcode.com

Trend of CNN-based classifiers

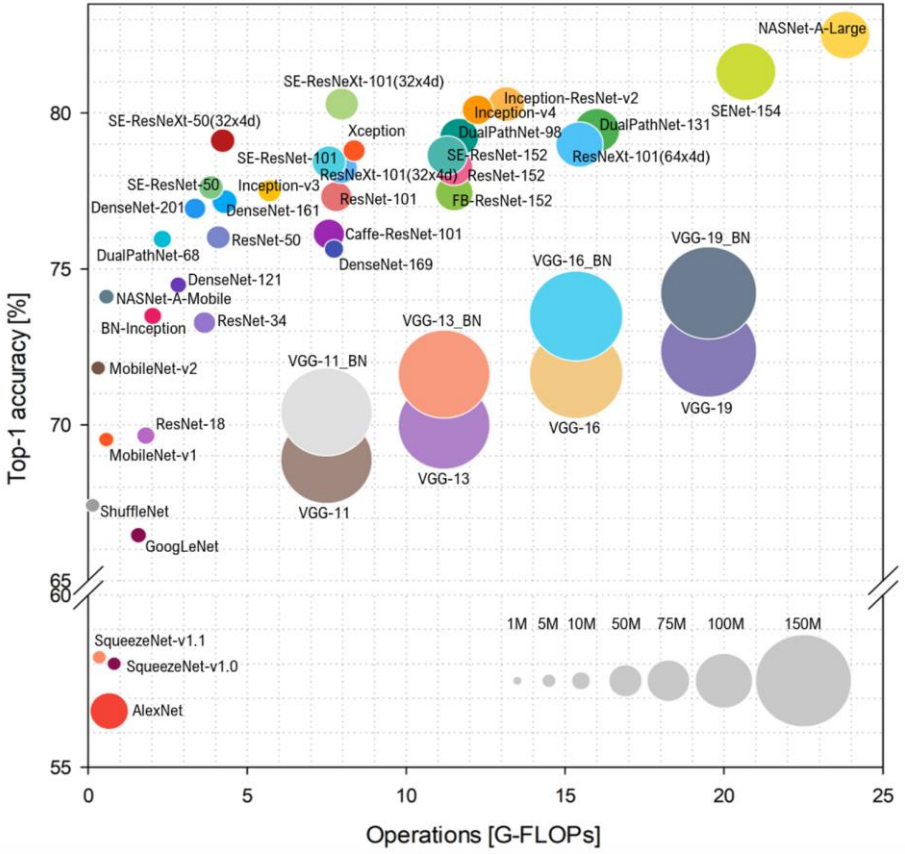


Comparison of popular CNN architectures. The vertical axis shows top 1 accuracy on ImageNet classification. The horizontal axis shows the number of operations needed to classify an image. Circle size is proportional to the number of parameters in the network.

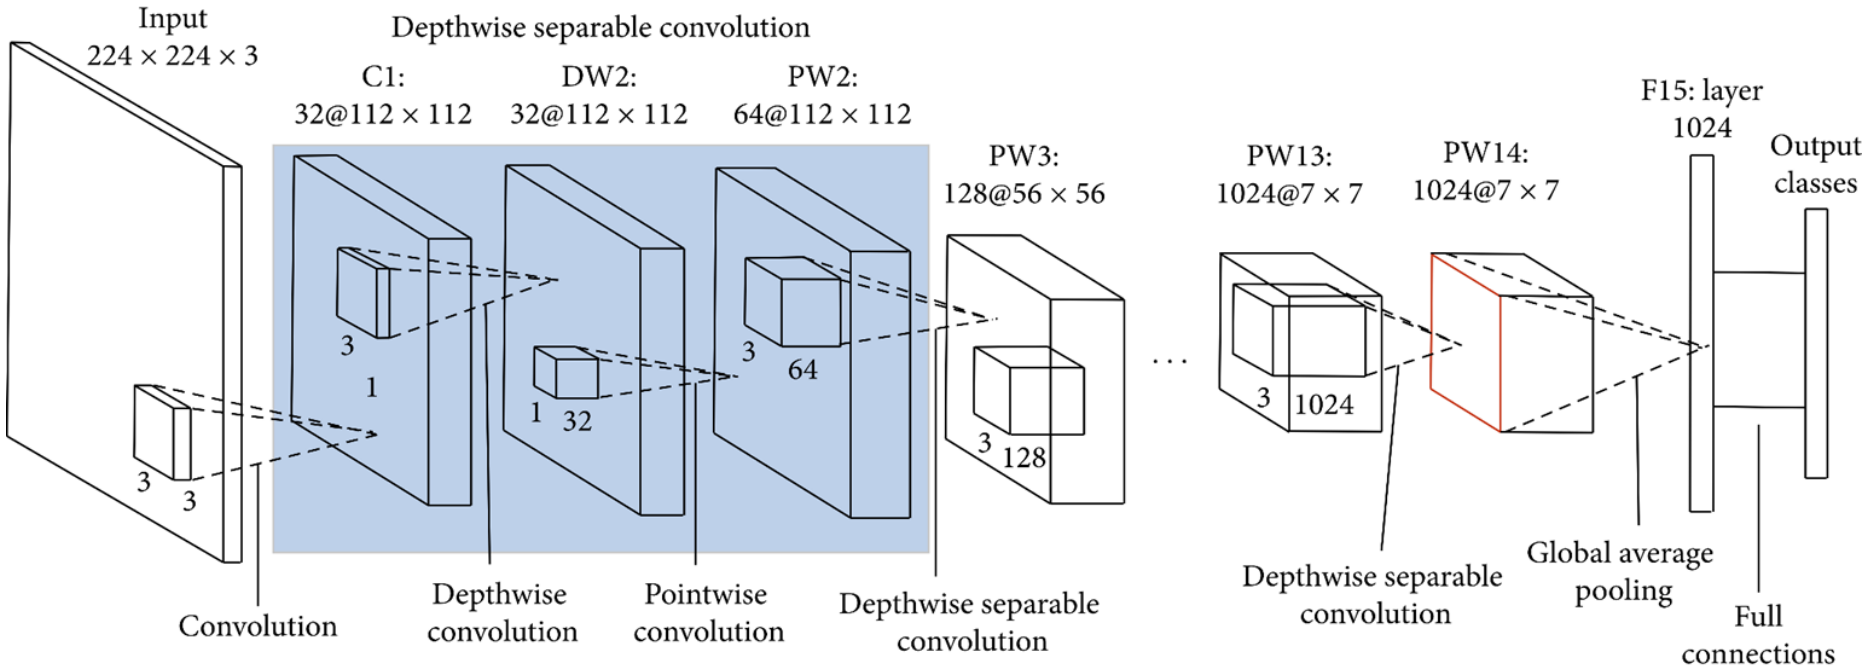
CNNs for edge devices

What do we want on edge?

- Low computational complexity
- Small model size for small memory
- Low energy usage
- Good enough accuracy (depends on application)
- Deployable on embedded processors
- Easily updatable (over-the-air)



MobileNets



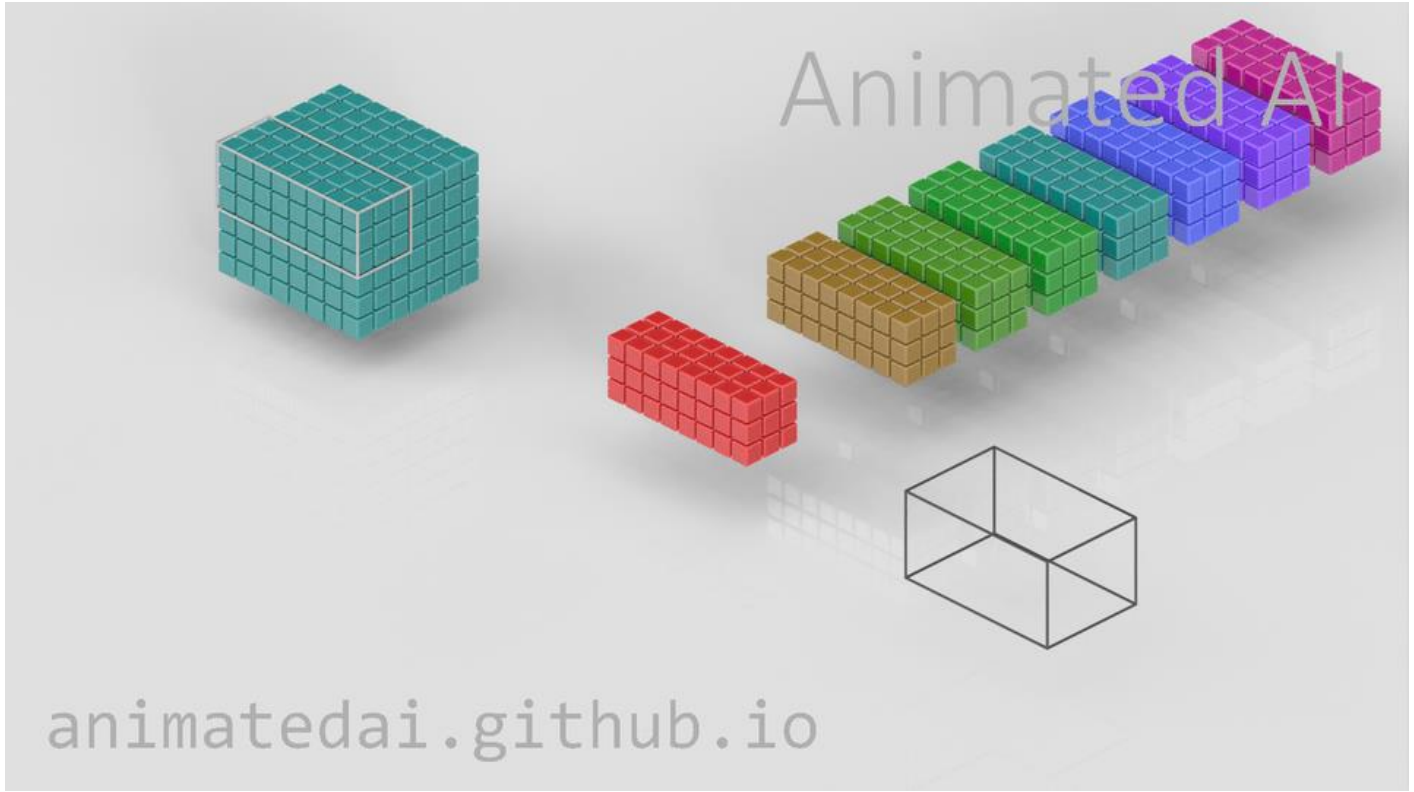
MobileNets

Regular convolution

Number of parameters for a K×K kernel:

K × K × N × M

N: input depth
M: output depth



MobileNets

Depthwise separable convolution

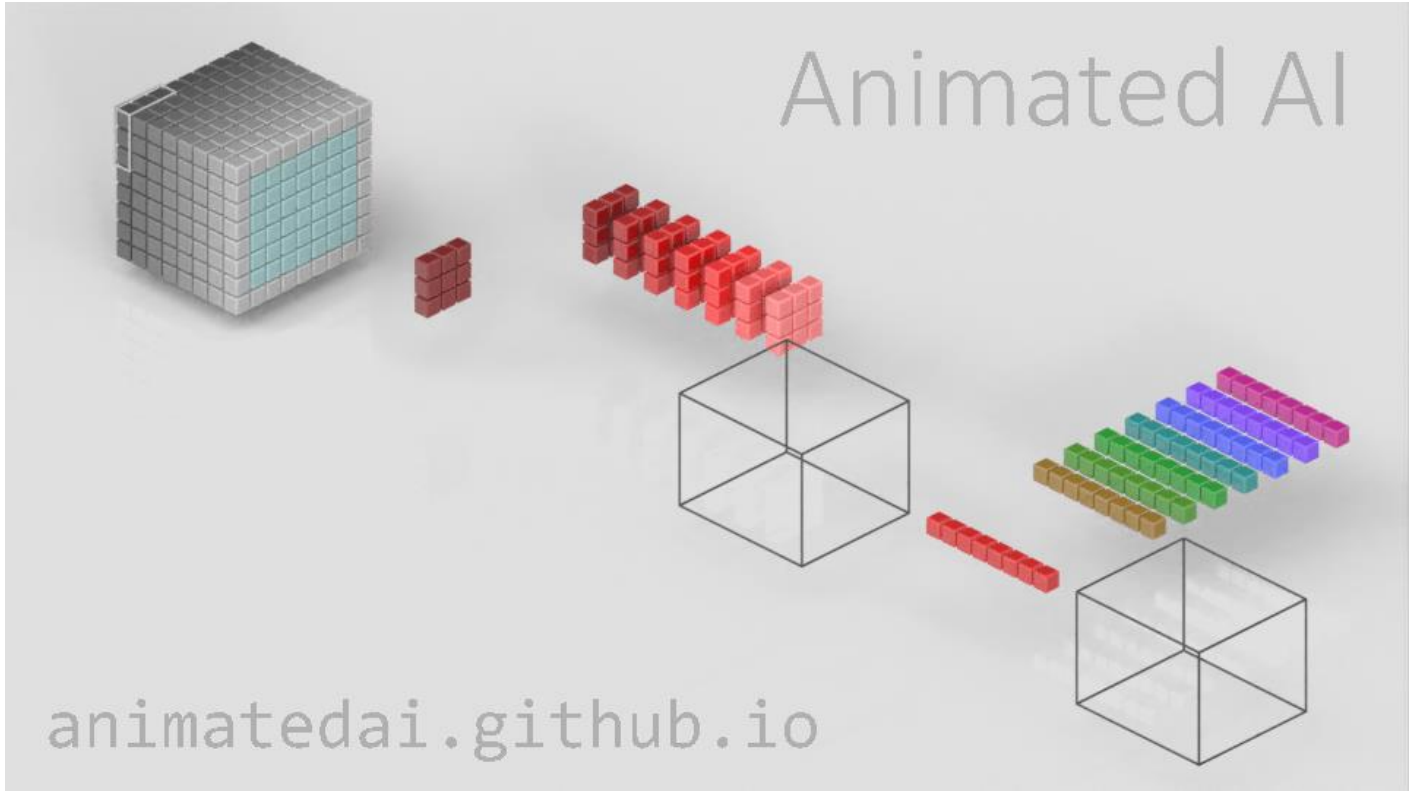
Number of parameters:

Depthwise:
- $K \times K \times N$

Pointwise:
- $1 \times 1 \times M$

Total:
- $K \times K \times N + M$

N: input depth
M: output depth



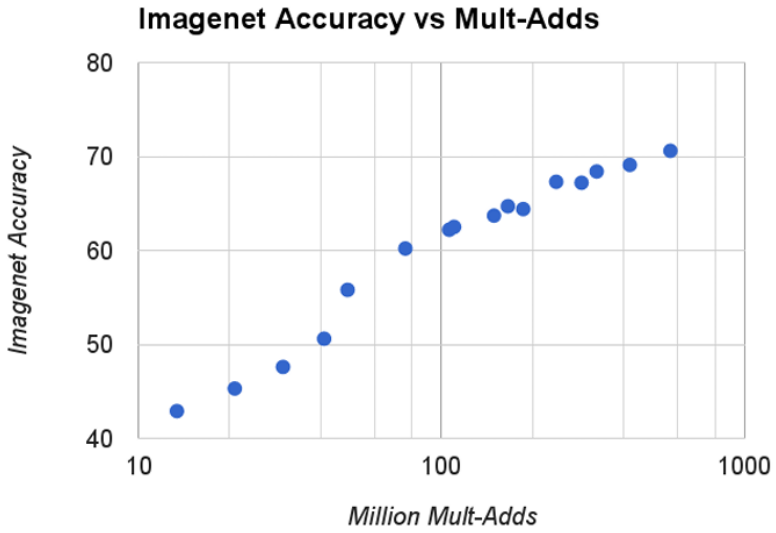
MobileNets

Model shrinking hyperparameter

Depth Multiplier :: Width Multiplier :: alpha :: α

To thin a network uniformly at each layer
Number of channels: M → αM

Width Multiplier	ImageNet Accuracy	Million Mult-Adds	Million Parameters
1.0 MobileNet-224	70.6%	569	4.2
0.75 MobileNet-224	68.4%	325	2.6
0.5 MobileNet-224	63.7%	149	1.3
0.25 MobileNet-224	50.6%	41	0.5



Log linear dependence between accuracy and computation

EfficientNets

Let's uniformly scale network width, depth, and resolution with a set of fixed scaling coefficients

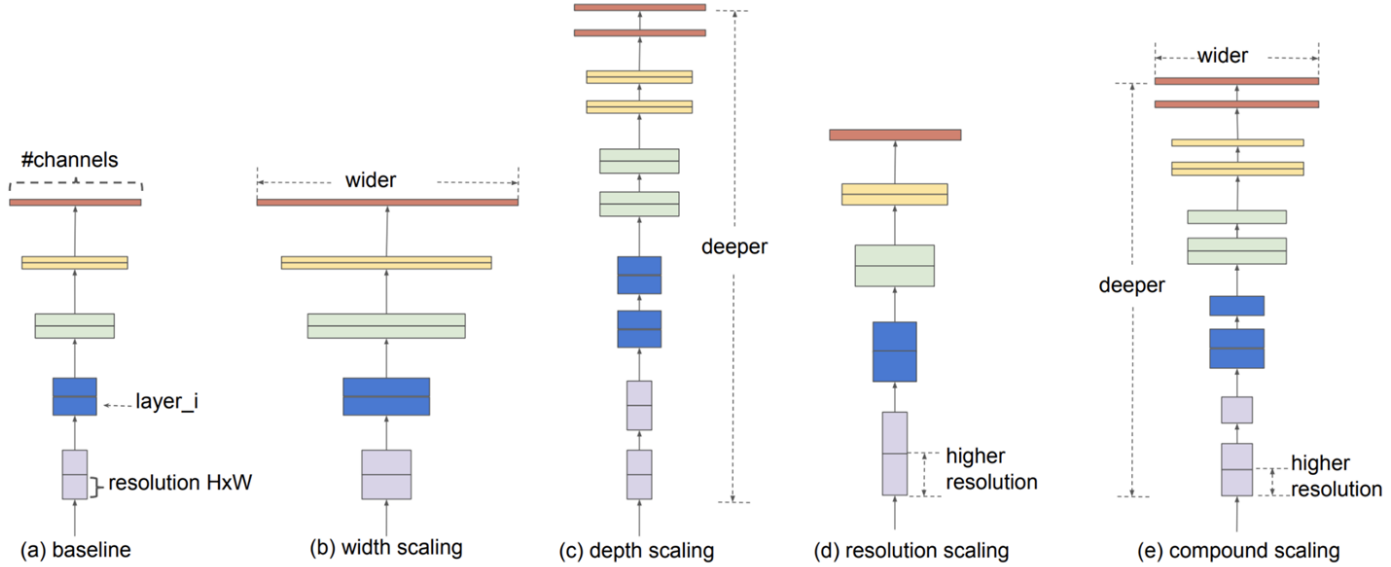


Figure 2. **Model Scaling.** (a) is a baseline network example; (b)-(d) are conventional scaling that only increases one dimension of network width, depth, or resolution. (e) is our proposed compound scaling method that uniformly scales all three dimensions with a fixed ratio.

EfficientNets

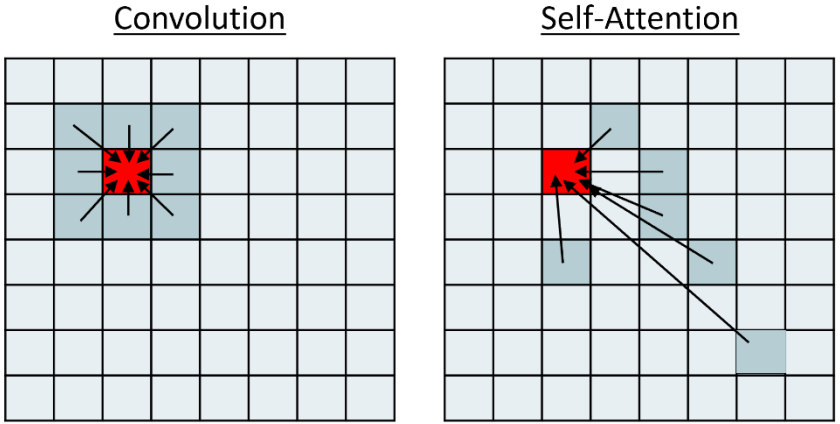
	Top1 Acc.	#Params
ResNet-152 (He et al., 2016)	77.8%	60M
EfficientNet-B1	**79.1%**	**7.8M**
ResNeXt-101 (Xie et al., 2017)	80.9%	84M
EfficientNet-B3	**81.6%**	**12M**
SENet (Hu et al., 2018)	82.7%	146M
NASNet-A (Zoph et al., 2018)	82.7%	89M
EfficientNet-B4	**82.9%**	**19M**
GPipe (Huang et al., 2018) †	84.3%	556M
EfficientNet-B7	**84.3%**	**66M**

†Not plotted

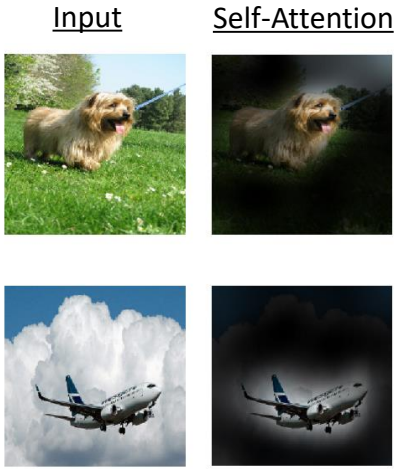
Note: the baseline B0 architecture is designed using neural architecture search (NAS).

The power of attention

- A mathematical mechanism that weighs the significance of each part of the input against all other parts in the input
- Training allows the model to learn how to calculate relevance between input parts based on the contextual content
- Removes the inductive biases we have placed on CNNs

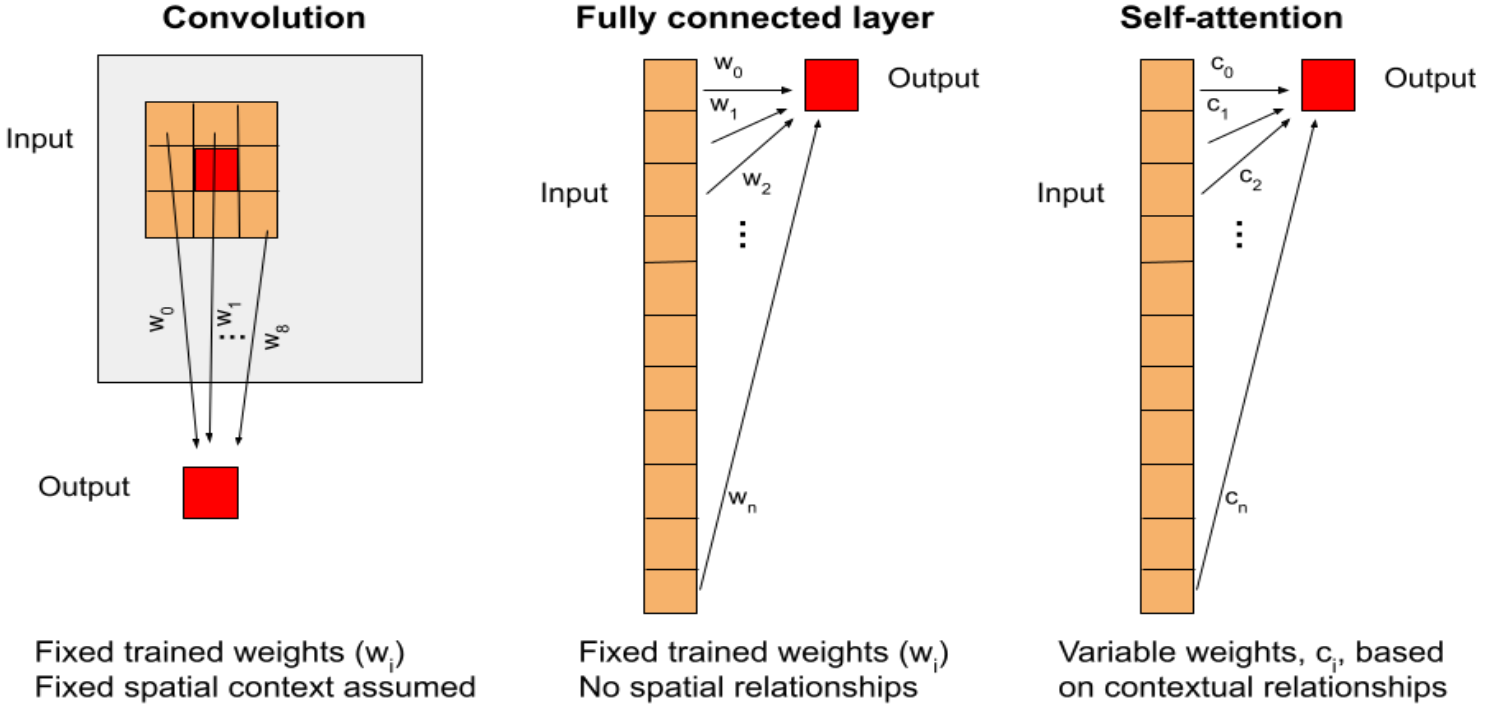


Source: Tom Michiels, Synopsys, Embedded Vision Summit 2022



Source: Dosovitskiy et al., An Image is Worth 16x16 words, ICLR 2021

A more generalized learning algorithm

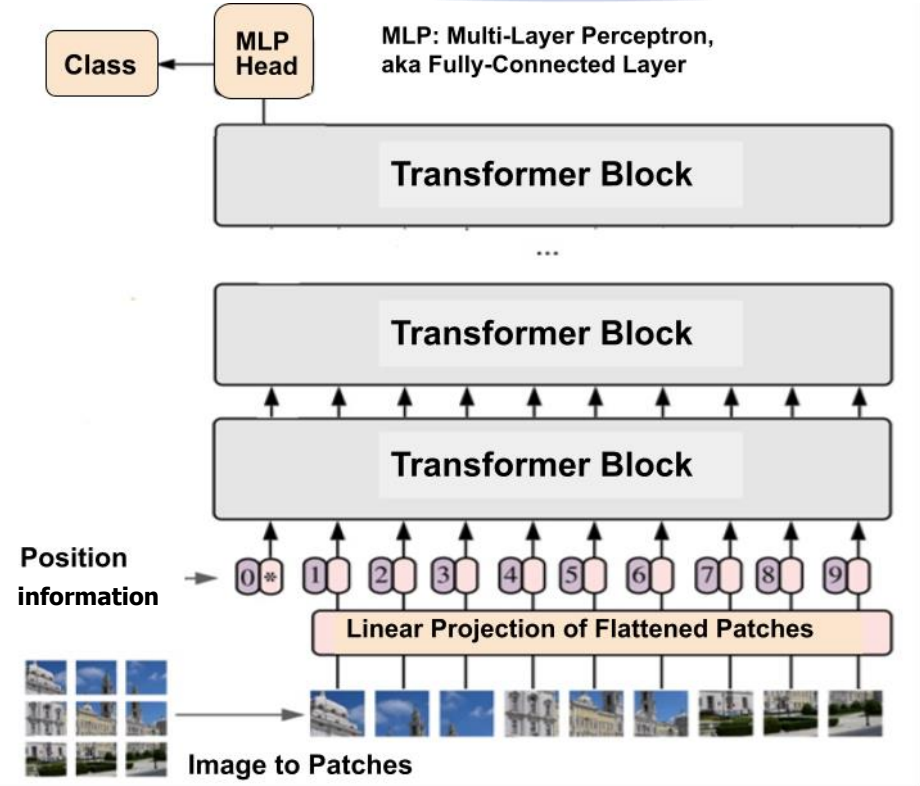


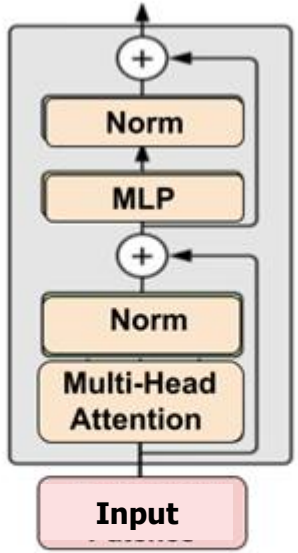
Fixed trained weights (w_i)
Fixed spatial context assumed

Fixed trained weights (w_i)
No spatial relationships

Variable weights, c_i, based on contextual relationships

High-level overview of the ViT





Transformer Block

Source: Dosovitskiy et al., An Image is Worth 16x16 words, ICLR 2021

What's the catch?

- There are open challenges…
  - Requires huge datasets to train (these are large-data regime models)
  - Computation and memory requirements increase quadratically with the number of input parts
  - Still computationally too expensive for edge inference*

* Transformer models with parameter sizes between 5 and 100 M, and computational requirements between 2 and 16 GFLOPs already exist. Source https://arxiv.org/pdf/2101.01169.pdf

CNNs vs. transformers

	CNNs	Transformers
Advantages	• Efficiency • Spatial hierarchy • Established frameworks	• Global context • Scalability: do better with more data and larger size
Disadvantages	• Limited context • Sensitivity to translation (e.g., rotation)	• Data hungry • Computationally intensive

What type of model should I use?

- Compare and contrast the features of CNNs and transformers, such as:
  - Input data representation (entire image vs patches)
  - Local features vs global features
  - Parameter efficiency (CNNs can achieve good performance with fewer parameters)
  - Training data requirements
  - Computational efficiency and memory requirements
  - Interpretability (which is one easier to interpret? CNNs are thought to be easier)

Conclusions

We talked about:

- Deep neural networks and CNNs as the network of choice for computer vision
- The building blocks of CNNs: Convolution layer, pooling layer, padding, stride, etc.
- Application of CNNs in computer vision: Image classification, object detection, segmentation, etc.
- CNN architectures: Inception, GoogleNet, ResNet
- Edge-optimized CNNs architectures: MobileNets & EfficientNets
- Attention mechanism and ViTs

Choosing the right model for an application and target hardware is crucial for accuracy and efficiency.
